Algebraic Numbers And Algebraic Functions:

Algebraic Numbers and Algebraic Functions Emil Artin, 2005 Originated from the notes of a course given at Princeton University in 1950 1951 this text offers an introduction to algebraic numbers and algebraic functions It starts with the general theory of valuation fields proceeds to the local class field theory and then to the theory of function fields in one variable

Algebraic Numbers and Algebraic Functions P.M. Cohn, 1991-09-01 This book is an introduction to the theory of algebraic numbers and algebraic functions of one variable The basic development is the same for both using E Artin's elegant approach via valuations Number Theory is pursued as far as the unit theorem and the finiteness of the class number In function theory the aim is the Abel Jacobi theorem describing the divisor class group with occasional geometrical asides to help understanding Assuming only an undergraduate course in algebra plus a little acquaintance with topology and complex function theory the book serves as an introduction to more technical works in algebraic number theory function theory or algebraic geometry by an exposition of the central themes in the subject

Algebraic Numbers and Algebraic Functions I Emil Artin, 1951 [Algebraic Numbers and Algebraic Functions](#) Emil Artin, 1967 **Introduction to the Theory of Algebraic Numbers and Functions** Martin Eichler, 1966 This book serves to introduce the general notions the concepts and the methods which underlie the theories of algebraic numbers and algebraic functions primarily in one variable It also introduces the theory of elliptic modular functions which has deep applications in analytic number theory [Algebraic Numbers and Algebraic Functions I](#) Emil Artin, 1951 **Introduction to the Theory of Algebraic Numbers and Functions**, 1966-01-01 Introduction to the Theory of Algebraic Numbers and Functions **Algebraic Numbers and Algebraic Functions** Emil Artin, 1951 [Algebraic Numbers and Algebraic Functions](#) P.M. Number Theory Helmut Koch, 2000 Algebraic number theory is one of the most refined creations in mathematics It has been developed by some of the leading mathematicians of this and previous centuries The primary goal of this book is to present the essential elements of algebraic number theory including the theory of normal extensions up through a glimpse of class field theory Following the example set for us by Kronecker Weber Hilbert and Artin algebraic functions are handled here on an equal footing with algebraic numbers This is done on the one hand to demonstrate the analogy between number fields and function fields which is especially clear in the case where the ground field is a finite field On the other hand in this

way one obtains an introduction to the theory of higher congruences as an important element of arithmetic geometry Early chapters discuss topics in elementary number theory such as Minkowski's geometry of numbers public key cryptography and a short proof of the Prime Number Theorem following Newman and Zagier Next some of the tools of algebraic number theory are introduced such as ideals discriminants and valuations These results are then applied to obtain results about function fields including a proof of the Riemann-Roch Theorem and as an application of cyclotomic fields a proof of the first case of Fermat's Last Theorem There is a detailed exposition of the theory of Hecke L-series following Tate and explicit applications to number theory such as the Generalized Riemann Hypothesis Chapter 9 brings together the earlier material through the study of quadratic number fields Finally Chapter 10 gives an introduction to class field theory The book attempts as much as possible to give simple proofs It can be used by a beginner in algebraic number theory who wishes to see some of the true power and depth of the subject The book is suitable for two one semester courses with the first four chapters serving to develop the basic material Chapters 6 through 9 could be used on their own as a second semester course

An Invitation To Algebraic Numbers And Algebraic Functions Franz Halter-Koch, 2020-05-04 The author offers a thorough presentation of the classical theory of algebraic numbers and algebraic functions which both in its conception and in many details differs from the current literature on the subject The basic features are Field theoretic preliminaries and a detailed presentation of Dedekind's ideal theory including non principal orders and various types of class groups the classical theory of algebraic number fields with a focus on quadratic cubic and cyclotomic fields basics of the analytic theory including the prime ideal theorem density results and the determination of the arithmetic by the class group a thorough presentation of valuation theory including the theory of difference discriminants and higher ramification The theory of function fields is based on the ideal and valuation theory developed before it presents the Riemann-Roch theorem on the basis of Weil differentials and highlights in detail the connection with classical differentials The theory of congruence zeta functions and a proof of the Hasse-Weil theorem represent the culminating point of the volume The volume is accessible with a basic knowledge in algebra and elementary number theory It empowers the reader to follow the advanced number theoretic literature and is a solid basis for the study of the forthcoming volume on the foundations and main results of class field theory Key features A thorough presentation of the theory of Algebraic Numbers and Algebraic Functions on an ideal and valuation theoretic basis Several of the topics both in the number field and in the function field case were not presented before in this context Despite presenting many advanced topics the text is easily readable Franz Halter-Koch is professor emeritus at the university of Graz He is the author of *Ideal Systems* Marcel Dekker 1998 *Quadratic Irrationals* CRC 2013 and a co author of *Non Unique Factorizations* CRC 2006

Encyclopaedia of Mathematical Sciences The author succeeded in an excellent way to describe the various points of view under which Class Field Theory can be seen In any case the author succeeded to write a very readable book on these difficult themes Monatshefte fuer Mathematik 1994 Koch's book is written mostly for non specialists It is an up to date account of the subject dealing with mostly general questions Special results appear only as illustrating examples for the general features of the theory It is supposed that the reader has good general background in the fields of modern abstract algebra and elementary number theory We recommend this volume mainly to graduate students and research mathematicians Acta Scientiarum Mathematicarum 1993

Transcendental and Algebraic Numbers A. O. Gelfond, 2015-01-05 Primarily an advanced study of the modern theory of transcendental and algebraic numbers this treatment by a distinguished Soviet mathematician focuses on the theory's fundamental methods The text also chronicles the historical development of the theory's methods and explores the connections with other problems in number theory The problem of approximating algebraic numbers is also studied as a case in the theory of transcendental numbers Topics include the Thue Siegel theorem the Hermite Lindemann theorem on the transcendency of the exponential function and the work of C Siegel on the transcendency of the Bessel functions and of the solutions of other differential equations The final chapter considers the Gelfond Schneider theorem on the transcendency of α to the power β Each proof is prefaced by a brief discussion of its scheme which provides a helpful guide to understanding the proof's progression
