Huajing Fang, 2020-05-21 This book explores the applications of ferroelectric materials in information technology by developing several prototype devices based on Pb Mg_{1/3}Nb_{2/3}O₃ PbTiO₃ PMN PT single crystals It describes how an optothermal field effect transistor FET was constructed on the PMN 26PT single crystal using a MoS₂ monolayer as the channel semiconductor material This fusion of pyroelectric effect and the interface engineering of 2D materials provides an effective strategy for the photon revolution of FET An ultra broadband photodetector UV THz was monolithically integrated into a 111 oriented PMN 28PT single crystal by using silver nanowires in the transparent top electrode The photodetector showed a dramatic improvement in operation frequency up to 3 kHz an order of magnitude higher than that of traditional pyroelectric photodetectors A self powered integrated module was demonstrated through the combination of a triboelectric nanogenerator and a ferroelectric FET The stored information can easily be written in the memory system using mechanical energy solving the power consumption problem with regard to information writing in ferroelectric nonvolatile memories This book extends the applications of ferroelectric single crystals into areas other than piezoelectric devices paving the way for exciting future developments Digital Image Processing Bernd Jähne, 2013-06-29 This chapter centers around the question of how to represent the information contained in images Together with the next two chapters it lays the mathematical foundations for low level image processing Two key points are emphasized in this chapter First the information contained in images can be represented in entirely different ways The most important are the spatial representation Section 2.2 and wave number representation Section 2.3 These representations just look at spatial data from different points of view Since the various representations are complete and equivalent they can be converted into each other The conversion between the spatial and wave number representation is the well known Fourier transform This transform is an example of a more general class of operations the unitary transforms Section 2.4 Second we discuss how these representations can be handled with digital computers How are images represented by arrays of digital numbers in an adequate way How are these data handled efficiently Can fast algorithms be devised to convert one representation into another A key example is the fast Fourier transform discussed in Section 2.5.2.2 Spatial Representation of Digital Images 2.2.1 Pixel and Voxel Images constitute a spatial distribution of the irradiance at a plane *Signal Processing and Performance Analysis for Imaging Systems* S.
