Chaotic Dynamics and Fractals Michael F. Barnsley, Stephen G. Demko, 2014-05-10 Chaotic Dynamics and Fractals covers the proceedings of the 1985 Conference on Chaotic Dynamics held at the Georgia Institute of Technology. This conference deals with the research area of chaos dynamical systems and fractal geometry. This text is organized into three parts encompassing 16 chapters. The first part describes the nature of chaos and fractals, the geometric tool for some strange attractors and other complicated sets of data associated with chaotic systems. This part also considers the Henon-Hiles Hamiltonian with complex time, a Henon family of maps from C^2 into itself and the idea of turbulent maps in the course of presenting results on iteration of continuous maps from the unit interval to itself. The second part discusses complex analytic dynamics and associated fractal geometry, specifically the bursts into chaos algorithms for obtaining geometrical and combinatorial information and the parameter space for iterated cubic polynomials. This part also examines the differentiation of Julia sets with respects to a parameter in the associated rational map, permitting the formulation of Taylor series expansion for the sets. The third part highlights the applications of chaotic dynamics and fractals. This book will prove useful to mathematicians, physicists and other scientists working in or introducing themselves to the field.

Inverse and Ill-Posed Problems Heinz W. Engl, C. W. Groetsch, 2014-05-10 Inverse and Ill-Posed Problems is a collection of papers presented at a seminar of the same title held in Austria in June 1986. The papers discuss inverse problems in various disciplines: mathematical solutions of integral equations of the first kind, general considerations for ill-posed problems and the various regularization methods for integral and operator equations of the first kind. Other papers deal with applications in tomography, inverse scattering, detection of radiation sources, optics, partial differential equations and parameter estimation problems. One paper discusses three topics on ill-posed problems: namely the imposition of specified types of discontinuities on solutions of ill-posed problems, the use of generalized cross validation as a data-based termination rule for iterative methods and also a parameter estimation problem in reservoir modeling. Another paper investigates a statistical method to determine the truncation level in Eigen function expansions and for Fredholm equations of the first kind where the data contains some errors. Another paper examines the use of singular function expansions in the inversion of severely ill-posed problems arising in confocal scanning microscopy, particle sizing and velocimetry. The collection can benefit many mathematicians, students and professors of calculus, statistics and advanced mathematics.

Chaos and Its Reconstruction Gérard Gouesbet, 2003 The editors of the Université et Institut National des Sciences Appliquées de Rouen, France, present six chapters exploring the application of chaos theory to such topics as the topological characterisation of attractors and the reconstruction of equations of motion from data. Specific topics include the development of a method of modelling called NARMAX (non linear autoregressive moving average models with exogenous
