technology and the many ways that physical ideas are manifest in everyday situations from the operation of rockets and cameras to space travel and X ray photography Automobile air bags drag racing artificial gravity and pollution control as well as appliance economics musical instruments radar and other modern phenomena and devices are discussed to emphasize the way that physical principles are applied in today s world Comprised of 21 chapters this book begins with an introduction to physical ideas with particular reference to some of the rules by which nature governs the microscopic or small scale world of atoms and the macroscopic or large scale realm of everyday objects the Earth planets and stars The discussion then turns to the microworld of physics and its fundamental building blocks electrons protons and neutrons and how they combine to form atoms molecules and nuclei Subsequent chapters explore motion heat wave and energy as well as the basic forces in nature Electricity relativity liquids and gases and radiation are also discussed This monograph is intended for physics students who are specializing in other disciplines

Electromagnetic Sources and Electromagnetic Fields Gaobiao Xiao,2024-01-16 This book presents a modified spherical harmonic expansion method in which the electromagnetic fields and their sources are expanded with the same set of spherical vector basis functions in a similar procedure Explicit expressions for the electromagnetic fields potentials energies and the related Green s functions are derived for the spherical modes in both frequency domain and time domain Based on the formulation the relationships between the electromagnetic sources the electromagnetic far fields and the electromagnetic near fields are clearly revealed In particular a nonuniform transmission line model is developed for intuitively characterizing the total radiation process The introduction of the cutoff radius and the cutoff mode degree provides a simple reference for determining the numbers of degrees of freedom of the fields associated with sources in a bounded region Based on the theory an efficient hybrid method for synthesizing antenna arrays with complex footprints is proposed and demonstrated with several numerical examples Effective algorithms are also developed for reconstructing the radiating part of the current sources This book is intended for researchers engineers and graduate students who are interested in studying the energy transfer in electromagnetic radiation synthesis and measurement of antenna arrays and applications of inverse electromagnetic source problems
