Interactions and Unified Theories Jean Thanh Vân Trần,1999 *Searches for CP Violation in Charmed Meson Decays* Hamish Gordon,2014-06-07 Our current understanding of the fundamental building blocks of the Universe summarised by the Standard Model of particle physics is incomplete For example it fails to explain why we do not see equal or almost equal numbers of particles and their antiparticle partners To explain this asymmetry requires among other effects a mechanism known as charge parity CP violation that causes differences between the rates at which particles and antiparticles decay CP violation is seen in systems containing bottom and strange quarks but not in those with up charm or top quarks This thesis describes searches for particle antiparticle asymmetries in the decay rates of charmed mesons No evidence of CP violation is found With current sensitivities an asymmetry large enough to observe probably could not be explained by the Standard Model Instead an explanation could come from new physics for example contributions from supersymmetric or other undiscovered heavy particles In the thesis the development of new techniques to search for these asymmetries is described They are applied to data from the LHCb experiment at CERN to make precise measurements of asymmetries in the $D^0 \rightarrow K^+ K^- \pi^0$ decay channel This is the most promising charged D decay for CP violation searches **Frontiers of Particle Beams:**
