Understanding and Bridging the Gap between Neuromorphic Computing and Machine Learning, volume II Huajin Tang,Lei Deng ,Kaushik Roy,2024-08-26 Towards the long standing dream of artificial intelligence two solution paths have been paved i neuroscience driven neuromorphic computing ii computer science driven machine learning The former targets at harnessing neuroscience to obtain insights for brain like processing by studying the detailed implementation of neural

dynamics circuits coding and learning Although our understanding of how the brain works is still very limited this bio plausible way offers an appealing promise for future general intelligence In contrast the latter aims at solving practical tasks typically formulated as a cost function with high accuracy by eschewing most neuroscience details in favor of brute force optimization and feeding a large volume of data With the help of big data e g ImageNet high performance processors e g GPU TPU effective training algorithms e g artificial neural networks with gradient descent training and easy to use design tools e g Pytorch Tensorflow machine learning has achieved superior performance in a broad spectrum of scenarios Although acclaimed for the biological plausibility and the low power advantage benefit from the spike signals and event driven processing there are ongoing debates and skepticisms about neuromorphic computing since it usually performs worse than machine learning in practical tasks especially in terms of the accuracy
