Communications, Computation, Control, and Signal Processing Arogyaswami Paulraj, Vwani Roychowdhury, Charles D. Schaper, 2012-12-06 A Paulraj V Roychowdhury and C Schaper Dept of Electrical Engineering Stanford University Dept of Electrical Engineering UCLA Innumerable conferences are held around the world on the subjects of communications computation control and signal processing and on their numerous subdisciplines Therefore one might not envision a coherent conference encompassing all these areas However such an event did take place June 22-26 1995 at an international symposium held at Stanford University to celebrate Professor Thomas Kailath's sixtieth birthday and to honor the notable contributions made by him and his students and associates The depth of these contributions was evident from the participation of so many leading figures in each of these fields Over the five days of the meeting there were about 200 attendees from eighteen countries more than twenty government and industrial organizations and various engineering mathematics and statistics faculties at nearly 50 different academic institutions They came not only to celebrate but also to learn and to ponder the threads and the connections that Professor Kailath has discovered and woven among so many apparently disparate areas The organizers received many comments about the richness of the occasion A distinguished academic wrote of the conference being the single most rewarding professional event of my life The program is summarized in Table 1.1 a letter of reflections by Dr C Rohrs appears a little later

Signal Processing in Telecommunications Ezio Biglieri,Marco Luise,2012-12-06

It is probably an overstatement to say that the discipline of telecommunication systems is becoming an application of digital signal processing DSP However there is no doubt that by the mid 1980s integrated circuit technology has advanced to such an extent that revolutionary advances in telecommunications are fostered by the introduction of new and powerful DSP algorithms Actually DSP has been recently playing a major role in the development of telecommunication systems to name just one of the most widespread applications where this interaction has been most effective we may mention the use of intelligent DSP to improve the performance of transmission systems by allowing sophisticated algorithm to be implemented in radio transmitters and receivers for personal communications Other areas have equally benefited by the latest advances of DSP speech coding and synthesis speech recognition and enhancement radar sonar digital audio and remote sensing just to cite a few With this in mind when choosing the topic for the 7th Tyrrhenian Workshop on Digital Communications whose contributions are collected in this book we aimed at focusing on the state of the art and the perspectives of the interaction between DSP and telecommunications two disciplines that are becoming increasingly intertwined Although by no means exhaustive of all the applications of DSP to telecommunications we believe that the material presented in this book pinpoints the most interesting among them and hence it will be considered as a useful tool for investigating this complex and highly challenging field

The Technology of Binaural Understanding Jens Blauert,Jonas Braasch,2020-08-12

Sound devoid of meaning would not

matter to us It is the information sound conveys that helps the brain to understand its environment Sound and its underlying meaning are always associated with time and space There is no sound without spatial properties and the brain always organizes this information within a temporal spatial framework This book is devoted to understanding the importance of meaning for spatial and related further aspects of hearing including cross modal inference People when exposed to acoustic stimuli do not react directly to what they hear but rather to what they hear means to them This semiotic maxim may not always apply for instance when the reactions are reflexive But where it does apply it poses a major challenge to the builders of models of the auditory system Take for example an auditory model that is meant to be implemented on a robotic agent for autonomous search rescue actions Or think of a system that can perform judgments on the sound quality of multimedia reproduction systems It becomes immediately clear that such a system needs Cognitive capabilities including substantial inherent knowledge The ability to integrate information across different sensory modalities To realize these functions the auditory system provides a pair of sensory organs the two ears and the means to perform adequate preprocessing of the signals provided by the ears This is realized in the subcortical parts of the auditory system In the title of a prior book the term Binaural Listening is used to indicate a focus on sub cortical functions Psychoacoustics and auditory signal processing contribute substantially to this area The preprocessed signals are then forwarded to the cortical parts of the auditory system where among other things recognition classification localization scene analysis assignment of meaning quality assessment and action planning take place Also information from different sensory modalities is integrated at this level Between sub cortical and cortical regions of the auditory system numerous feedback loops exist that ultimately support the high complexity and plasticity of the auditory system The current book concentrates on these cognitive functions Instead of processing signals processing symbols is now the predominant modeling task Substantial contributions to the field draw upon the knowledge acquired by cognitive psychology The keyword Binaural Understanding in the book title characterizes this shift Both books The Technology of Binaural Listening and the current one have been stimulated and supported by AABBA an open research group devoted to the development and application of models of binaural hearing The current book is dedicated to technologies that help explain facilitate apply and support various aspects of binaural understanding It is organized into five parts each containing three to six chapters in order to provide a comprehensive overview of this emerging area Each chapter was thoroughly reviewed by at least two anonymous external experts The first part deals with the psychophysical and physiological effects of Forming and Interpreting Aural Objects as well as the underlying models The fundamental concepts of reflexive and reflective auditory feedback are introduced Mechanisms of binaural attention and attention switching are covered as well as how auditory Gestalt rules facilitate binaural understanding A general blackboard architecture is introduced as an example of how machines can learn to form and interpret aural objects to simulate human cognitive listening The second part Configuring and Understanding Aural Space focuses on the human understanding of

complex three dimensional environments covering the psychological and biological fundamentals of auditory space formation This part further addresses the human mechanisms used to process information and interact in complex reverberant environments such as concert halls and forests and additionally examines how the auditory system can learn to understand and adapt to these environments The third part is dedicated to Processing Cross Modal Inference and highlights the fundamental human mechanisms used to integrate auditory cues with cues from other modalities to localize and form perceptual objects This part also provides a general framework for understanding how complex multimodal scenes can be simulated and rendered The fourth part Evaluating Aural scene Quality and Speech Understanding focuses on the object forming aspects of binaural listening and understanding It addresses cognitive mechanisms involved in both the understanding of speech and the processing of nonverbal information such as Sound Quality and Quality of Experience The aesthetic judgment of rooms is also discussed in this context Models that simulate underlying human processes and performance are covered in addition to techniques for rendering virtual environments that can then be used to test these models The fifth part deals with the Application of Cognitive Mechanisms to Audio Technology It highlights how cognitive mechanisms can be utilized to create spatial auditory illusions using binaural and other 3D audio technologies Further it covers how cognitive binaural technologies can be applied to improve human performance in auditory displays and to develop new auditory technologies for interactive robots The book concludes with the application of cognitive binaural technologies to the next generation of hearing aids
