An Application Science for Multi-Agent Systems
Thomas A. Wagner, 2006-04-11 An Application Science For Multi Agent Systems addresses the complexity of choosing which multi agent control technologies are appropriate for a given problem domain or a given application Without such knowledge when faced with a new application domain agent developers must rely on past experience and intuition to determine whether a multi agent system is the right approach and if so how to structure the agents how to decompose the problem and how to coordinate the activities of the agents and so forth This unique collection of contributions written by leading international researchers in the agent community provides valuable insight into the issues of deciding which technique to apply and when it is appropriate to use them The contributions also discuss potential trade offs or caveats involved with each decision An Application Science For Multi Agent Systems is an excellent reference for anyone involved in developing multi agent systems

National Security Intelligence Loch K. Enactive Cognition in Place Miguel A. Sepúlveda-Pedro, 2023-01-01 This book aims to enrich our understanding of the role the environment plays in processes of life and cognition from the perspective of enactive cognitive science Miguel A Sep lveda

Pedro offers an unprecedented interpretation of the central claims of the enactive approach to cognition supported by contemporary works of ecological psychology and phenomenology. The enactive approach conceives cognition as sense making a phenomenon emerging from the organizational nature of the living body that evolves in human beings through sensorimotor intercorporeal and linguistic interactions with the environment. From this standpoint Sep lveda Pedro suggests incorporating three new theses into the theoretical body of the enactive approach: sense making and cognition fundamentally consist of processes of norm development; the environment cognitive agents actually interact with is an active ecological field enacted in their historical past; and sense making occurs in a domain consisting of multiple normative dimensions that the author names enactive place.

Mobile Agents A. Genco, 2008. Mobile agents are intelligent agents with advanced mobility capabilities. A mobile agent must be provided with the so called strong mobility a feature which allows it to carry its status with it and accomplish its mission by migrating from site to site in the Internet. A mobile agent can complete in a site what it started in another site. Starting from the mobile agent concept this book provides the reader with a suitably detailed discussion on mobile agent principles of operation as for instance migration, communication, co-ordination, interoperability, fault tolerance and security. As an example of mobile agents application fields this book discusses how they can be effective in implementing data mining and information retrieval systems.

Agents and Peer-to-Peer Computing Gianluca Moro, Claudio Sartori, 2004-12-03. Peer to peer P2P computing is currently attracting enormous public attention spurred by the popularity of file sharing systems such as Napster, Gnutella, Morpheus, Kazaa and several others. In P2P systems a very large number of autonomous computing nodes, the peers, rely on each other for services. P2P networks are emerging as a new distributed computing paradigm because of their potential to harness the computing power and the storage capacity of the hosts composing the network and because they realize a completely open decentralized environment where everybody can join in autonomously. Although researchers working on distributed computing, multiagent systems, databases and networks have been using similar concepts for a long time, it is only recently that papers motivated by the current P2P paradigm have started appearing in high quality conferences and workshops. In particular, research on agent systems appears to be most relevant because multiagent systems have always been thought of as networks of autonomous peers since their inception. Agents which can be superimposed on the P2P architecture embody the description of task environments, decision support capabilities, social behaviors, trust and reputation and interaction protocols among peers. The emphasis on decentralization, autonomy, ease and speed of growth that gives P2P its advantages also leads to significant potential problems. Most prominent among these are coordination, the ability of an agent to make decisions on its own actions in the context of activities of other agents and scalability, the value of the P2P systems in how well they self-organize so as to scale along several dimensions including complexity, heterogeneity of peers, robustness, traffic redistribution etc. This book brings together an introduction, three invited articles and revised versions of the papers presented at the Second International
