Abstract

POLÁK P., MIKUŠ R., KROČKO V.: 2014, Monitoring of conditions of agricultural machines' parts in operation. Res. Agr. Eng., 60 (Special Issue): S57–S65.

This contribution focuses on problems of monitoring the runout of tractor diesel motor parts used in agricultural operation. Crankshafts from the agricultural tractors of type Zetor 6911 are used as samples for measuring the runout and circularity. The first sample of the crankshaft is loaded in the tractor used in livestock production, and the second one is used in vegetable production. Measured values of the runout and circularity of both samples are evaluated by tables and polar diagrams. Results of the experiment show the amount of runout and the following wear of agricultural machine parts in different operating conditions of agricultural production.

Keywords: crankshaft; deviation; circularity; runout measurement; wear

The importance of usage of agricultural equipment is in elimination of any hard work (LÍŠKA 2008; PONIČAN, KORENKO 2008). The wear of several parts and a decrement of machine operability occur during the usage of agricultural equipment in the manufacturing process (PÁLMIK 2007). The lifetime of agricultural machines has to be dealt with when economic effectiveness is the topic. Depreciation charge, return on investment and operation expenditures ratio put into machinery and technico-economic evaluation of used and new machines and technologies along with their appropriate reproduction could not be done without knowing the lifetime. Agricultural machinery lifetime knowledge is essential for manufacturer production amount and selection of machines and spare parts (Kročko et al. 2007). Lifetime optimisation rules are valid generally, in the present economical environment too. The machinery should be replaced after an optimum operation time, in the moment of the lowest unit operation costs (DRUŠČKA, MIKUŠ 2007).

An example can be the crankshaft of the agricultural tractor. This contribution deals with problems of monitoring the runout of tractor diesel motors parts that are used in agricultural operation. Measurements of runout and circularity are accomplished on the crankshafts of the agricultural tractors of type Zetor 6911 (Zetor Brno, Czech Republic). Measured values of runout and circularity are evaluated by tables and polar diagrams in the experiment. The results allow comparing the amount of runout and the following wear of individual machine parts in different agricultural operations.

Turbocharged diesel engine is currently the most preferred for medium-sized drives in drive units (tractors, trucks, marine drives). In addition, continually increasing share in the highly competitive automotive market due to its reliability, combines with very low fuel consumption. During the past decade, mathematical modeling has paved the way for an in-depth study of diesel engines. However, most research has focused on thermodynamics,
