Airborne Particles:

Airborne Particles in Museums The Getty Conservation Institute, 1993-11-04 This study represents the latest in a series of research activities aimed at a better understanding of the origin and fate of air pollution within the built environment. Most previous studies of air pollution in cultural institutions have focused on gases. Particles were ignored for many reasons; they seemed to be more easily removed by the building gaseous air pollutants had been well studied by industry and their effects on commercial products were heavily documented and many particle types were considered chemically benign to almost all surfaces. Even carbon black which is now known to pose enormous degradation risks to the optical and color qualities of paintings and tapestries is almost totally inert. Recognizing this and understanding that we needed to know much more about the physics of particle intrusion in museum buildings in 1987 the Environmental Engineering Lab at the California Institute of Technology under contract to the Getty Conservation Institute began a detailed examination of five different museums in Southern California. These structures represent a diverse range of architectural and ventilation types. Through this study a powerful computer model was developed that could predict the soiling effects of changes made to the operation or maintenance of a building. This model can even be used to estimate the soiling rates of new buildings or major rehabilitations before any construction work is begun. This is an important contribution to both the conservation community and the broader field of air quality science.

Airborne Particulate Matter Saurabh Sonwani, Anuradha Shukla, 2022-05-25 This book is about airborne particulate matter sources chemistry and health and contained a complete information about their emission source transport atmospheric chemistry distribution at local regional and global levels and their level in indoor and outdoor settings. Primary and secondary particulate matters in the ambient atmosphere also describe in detail Analytical techniques statistical tools and mathematical models used in airborne particulate research is also described. This book also covers the important aspects of the particulate matter chemistry in atmosphere and their adverse impact on plant and human health. A detailed insight about the harmful impact of airborne particulate matter biogenic and anthropogenic both on different human system is described in detail. The toxicological significance of particulate matter on human body was also mentioned. The mitigation management and regulatory policies to control ambient particulate matter is also provided. This book is also written in simple language with helpful photographs diagrams tables and flowcharts which will make the reader comfortable in understanding the concepts a more relatively easier way. Overall the present book is a valuable tool for students working in the fields of Atmospheric Science Environmental Science Biological Sciences Epidemiology and Agriculture Science. This book also a unique resource for environmental consultants researchers policymakers and other professionals involved in air quality plant and human health.

pressures combined with a realization of the interconnectedness and complexity of environmental systems present new challenges to policymakers and regulators. Scientific research has played and will continue to play an essential part in solving environmental problems. Decisions based on incorrect or incomplete understanding of environmental systems will not achieve the greatest reduction of risk at the lowest cost. This volume describes a framework for acquiring the knowledge needed both to solve current recognized problems and to be prepared for the kinds of problems likely to emerge in the future. Many case examples are included to illustrate why some environmental control strategies have succeeded where others have fallen short and how we can do better in the future.
