among artificial intelligence algorithms. Among them are global optimization algorithms called swarm intelligence algorithms. These algorithms that use the behavior of simple agents and various ways of cooperation between them are used to solve specific problems that are defined by the so called objective function. Swarm intelligence algorithms are inspired by the social behavior of various animal species e.g. ant colonies, bird flocks, bee swarms, schools of fish etc. The family of these algorithms is very large and additionally includes various types of modifications to enable swarm intelligence algorithms to solve problems dealing with areas other than those for which they were originally developed. This book presents 24 swarm algorithms together with their modifications and practical applications. Each chapter is devoted to one algorithm. It contains a short description along with a pseudo code showing the various stages of its operation. In addition, each chapter contains a description of selected modifications of the algorithm and shows how it can be used to solve a selected practical problem. This book should also be useful for undergraduate and postgraduate students studying nature based optimization algorithms and can be a helpful tool for learning these algorithms along with their modifications and practical applications. In addition, it can be a useful source of knowledge for scientists working in the field of artificial intelligence as well as for engineers interested in using this type of algorithms in their work. If the reader wishes to expand his knowledge beyond the basics of swarm intelligence algorithms presented in this book and is interested in more detailed information, we recommend the book *Swarm Intelligence Algorithms: A Tutorial* Edited by A. Slowik, CRC Press, 2020. It contains a detailed explanation of how each algorithm works along with relevant program codes in Matlab and the C programming language as well as numerical examples illustrating step by step how individual algorithms work.

Intelligent Problem Solving. Methodologies and Approaches Rasiah Logananthara, Günther Palm, Moonis Ali, 2000-06-07. The focus of the papers presented in these proceedings is on employing various methodologies and approaches for solving real life problems. Although the mechanisms that the human brain employs to solve problems are not yet completely known, we do have good insight into the functional processing performed by the human mind. On the basis of the understanding of these natural processes, scientists in the field of applied intelligence have developed multiple types of artificial processes and have employed them successfully in solving real life problems. The types of approaches used to solve problems are dependant on both the nature of the problem and the expected outcome. While knowledge based systems are useful for solving problems in well understood domains with relatively stable environments, the approach may fail when the domain knowledge is either not very well understood or changing rapidly. The techniques of data discovery through data mining will help to alleviate some problems faced by knowledge based approaches to solving problems in such domains. Research and development in the area of artificial intelligence are influenced by opportunity needs and the availability of resources. The rapid advancement of Internet technology and the trend of increasing bandwidths provide an opportunity and a need for intelligent information processing, thus creating an excellent opportunity for agent based computations and learning. Over 40% of the papers appearing in the conference

proceedings focus on the area of machine learning and intelligent agents clear evidence of growing interest in this area

These are the proceedings of the 7th International Workshop on Cooperative Information Agents CIA 2003 held at the Sonera Conference Center in Helsinki Finland August 27-29 2003 It was co-located with the 4th Agentcities Information Days One key challenge of developing advanced agent-based information systems is to balance the autonomy of networked data and knowledge sources with the potential payoff of leveraging them by the appropriate use of intelligent information agents on the Internet An information agent is a computational software entity that has access to one or multiple heterogeneous and distributed data and information sources proactively searches for and maintains relevant information on behalf of its human users or other agents preferably just in time In other words it is managing and overcoming the difficulties associated with information overload in the open and exponentially growing Internet and Web Depending on the application and tasks at hand information agents may collaborate in open networked data and information environments to provide added value to a variety of applications in different domains Thus research and development of information agents is inherently interdisciplinary It requires expertise in information retrieval artificial intelligence database systems human-computer interaction and Internet and Web technology Initiated in 1997 the purpose of the annual international workshop series on cooperative information agents CIA is to provide an interdisciplinary forum for researchers software developers and managers to get informed about present and discuss the latest high quality results in advancements of theory and practice in information agent technology for the Internet and Web Each event of this renowned series attempts to capture the intrinsic interdisciplinary nature of this research area by calling for contributions from different research communities and by promoting open and informative discussions on all related topics Interdisciplinary Approaches to Adaptive Learning: A Look at the Neighbours
