Alloy Design and Process Innovations Prashanth Konda Gokuldoss, Zhi Wang, 2020-04-15 Additive manufacturing AM is one of the manufacturing processes that warrants the attention of industrialists researchers and scientists because of its ability to produce materials with a complex shape without theoretical restrictions and with added functionalities There are several advantages to employing additive manufacturing as the primary additive manufacturing process However there exist several challenges that need to be addressed systematically A couple such issues are alloy design and process development Traditionally alloys designed for conventional cast powder metallurgical processes were fabricated using advanced AM processes This is the wrong approach considering that the alloys should be coined based on the process characteristics and meta stable nature of the process Hence we must focus on alloy design and development for AM that suits the AM processes The AM processes however improve almost every day either in terms of processing capabilities or processing conditions Hence the processing part warrants a section that is devoted to these advancements and innovations Accordingly the present Special Issue book focuses on two aspects of alloy development and process innovations Here 45 articles are presented covering different AM processes including selective laser melting electron beam melting laser cladding direct metal laser sintering ultrasonic consolidation wire arc additive manufacturing and hybrid manufacturing I believe that this Special Issue bears is vital to the field of AM and will be a valuable addition

Production of Biofuels and Numerical Modeling of Chemical Combustion Systems Miguel Torres García, Juan Francisco García Martín, 2021-08-18 Biofuels have recently attracted a lot of attention mainly as alternative fuels for applications in energy generation and transportation The utilization of biofuels in such controlled combustion processes has the great advantage of not depleting the limited resources of fossil fuels while leading to emissions of greenhouse gases and smoke particles similar to those of fossil fuels On the other hand a vast amount of biofuels are subjected to combustion in small scale processes such as for heating and cooking in residential dwellings as well as in agricultural operations such as crop residue removal and land clearing In addition large amounts of biomass are consumed annually during forest and savanna fires in many parts of the world These types of burning processes are typically uncontrolled and unregulated Consequently the emissions from these processes may be larger compared to industrial type operations Aside from direct effects on human health especially due to a sizeable fraction of the smoke emissions remaining inside residential homes the smoke particles and gases released from uncontrolled biofuel combustion impose significant effects on the regional and global climate Estimates have shown the majority of carbonaceous airborne particulate matter to be derived from the combustion of biofuels and biomass Production

of Biofuels and Numerical Modelling of Chemical Combustion Systems comprehensively overviews and includes in depth technical research papers addressing recent progress in biofuel production and combustion processes To be specific this book contains sixteen high quality studies fifteen research papers and one review paper addressing techniques and methods for bioenergy and biofuel production as well as challenges in the broad area of process modelling and control in combustion processes
