Adaptive Signal Models Theory Algorithms And Audio Applications:

Adaptive Signal Models Michael M. Goodwin, 2012-09-10 Adaptive Signal Models Theory Algorithms and Audio Applications presents methods for deriving mathematical models of natural signals The introduction covers the fundamentals of analysis synthesis systems and signal representations Some of the topics in the introduction include perfect and near perfect reconstruction the distinction between parametric and nonparametric methods the role of compaction in signal modeling basic and overcomplete signal expansions and time frequency resolution issues These topics arise throughout the book as do a number of other topics such as filter banks and multiresolution The second chapter gives a detailed development of the sinusoidal model as a parametric extension of the short time Fourier transform This leads to multiresolution sinusoidal modeling techniques in Chapter Three where wavelet like approaches are merged with the sinusoidal model to yield improved models In Chapter Four the analysis synthesis residual is considered for realistic synthesis the residual must be separately modeled after coherent components such as sinusoids are removed The residual modeling approach is based on psychoacoustically motivated nonuniform filter banks Chapter Five deals with pitch synchronous versions of both the wavelet and the Fourier transform these allow for compact models of pseudo periodic signals Chapter Six discusses recent algorithms for deriving signal representations based on time frequency atoms primarily the matching pursuit algorithm is reviewed and extended The signal models discussed in the book are compact adaptive parametric time frequency representations that are useful for analysis coding modification and synthesis of natural signals such as audio The models are all interpreted as methods for decomposing a signal in terms of fundamental time frequency atoms these interpretations as well as the adaptive and parametric natures of the models serve to link the various methods dealt with in the text Adaptive Signal Models Theory Algorithms and Audio Applications serves as an excellent reference for researchers of signal processing and may be used as a text for advanced courses on the topic *Algorithms and Software for Predictive and Perceptual Modeling of Speech* Venkatraman Atti, 2022-05-31 From the early pulse code modulation based coders to some of the recent multi rate wideband speech coding standards the area of speech coding made several significant strides with an objective to attain high quality of speech at the lowest possible bit rate This book presents some of the recent advances in linear prediction LP based speech analysis that employ perceptual models for narrow and wide band speech coding The LP analysis synthesis framework has been successful for speech coding because it fits well the source system paradigm for speech synthesis Limitations associated with the conventional LP have been studied extensively and several extensions to LP based analysis synthesis have been proposed e g the discrete all pole modeling the perceptual LP the warped LP the LP with modified filter structures the IIR based pure LP all pole modeling using the weighted sum of LSP polynomials the LP for low frequency emphasis and the cascade form LP These extensions can be classified as algorithms that either attempt to improve the LP spectral envelope fitting performance or embed perceptual models in the LP The first

half of the book reviews some of the recent developments in predictive modeling of speech with the help of Matlab™ Simulation examples Advantages of integrating perceptual models in low bit rate speech coding depend on the accuracy of these models to mimic the human performance and more importantly on the achievable coding gains and computational overhead associated with these physiological models Methods that exploit the masking properties of the human ear in speech coding standards even today are largely based on concepts introduced by Schroeder and Atal in 1979 For example a simple approach employed in speech coding standards is to use a perceptual weighting filter to shape the quantization noise according to the masking properties of the human ear The second half of the book reviews some of the recent developments in perceptual modeling of speech e g masking threshold psychoacoustic models auditory excitation pattern and loudness with the help of Matlab™ simulations Supplementary material including Matlab™ programs and simulation examples presented in this book can also be accessed here Table of Contents Introduction Predictive Modeling of Speech Perceptual Modeling of Speech [Audio Signal Processing and Coding](#) Andreas Spanias, Ted Painter, Venkatraman Atti, 2006-09-11 An in depth treatment of algorithms and standards for perceptual coding of high fidelity audio this self contained reference surveys and addresses all aspects of the field Coverage includes signal processing and perceptual psychoacoustic fundamentals details on relevant research and signal models details on standardization and applications and details on performance measures and perceptual measurement systems It includes a comprehensive bibliography with over 600 references computer exercises and MATLAB based projects for use in EE multimedia computer science and DSP courses An ftp site containing supplementary material such as wave files MATLAB programs and workspaces for the students to solve some of the numerical problems and computer exercises in the book can be found at ftp://ftp.wiley.com/public/sci_tech_med/audio_signal **Hidden Markov Models** Przemyslaw Dymarski, 2011-04-19 Hidden Markov Models HMMs although known for decades have made a big career nowadays and are still in state of development This book presents theoretical issues and a variety of HMMs applications in speech recognition and synthesis medicine neurosciences computational biology bioinformatics seismology environment protection and engineering I hope that the reader will find this book useful and helpful for their own research
