widely accepted amongst anthropologists that when they conducted fieldwork with foreign cultures they experienced something called culture shock This book will argue that culture shock is a useful model for understanding an important part of human experience However in its most widely known form the stage model culture shock has been heavily influenced by the same anti science latter day religiosity that has become so influential more broadly Multiculturalism This book will

examine culture shock through the model of religion It will show how the most well known model of culture shock so popular amongst business consultants expatriates international students and travelers has become a means of promoting and sustaining this replacement religion which includes everything from dogmatism and fervour to conversion experience By so doing it will aim both to better understand culture shock and to show how it can still be useful if divorced from its implicitly religious dimensions to broadly scientific scholars It will also suggest how anthropology itself might be stripped of its ideological infiltration and returned to the realm of science

Autonomic Nervous System David S. Goldstein, 2013-11-11 This chapter conveys several concepts and points of view about the scientific and medical significance of differential alterations in activities of components of the autonomic nervous system in stress and disease The use of terms such as the autonomic nervous system autonomic failure dysautonomia and autonomic dysfunction imply the existence of a single entity however the autonomic nervous system has functionally and neurochemically distinctive components which are reflected in differential responses to stressors and differential involvement in pathophysiologic states One can conceptualize the autonomic nervous system as having at least five components the sympathetic noradrenergic system the sympathetic cholinergic system the parasympathetic cholinergic system the sympathetic adrenergic system and the enteric nervous system Evidence has accumulated for differential noradrenergic vs adrenergic responses in various situations The largest sympathetic adrenergic system responses are seen when the organism encounters stressors that pose a global or metabolic threat Sympathetic noradrenergic system activation dominates the responses to orthostasis moderate exercise and exposure to cold whereas sympathetic adrenergic system activation dominates those to glucoprivation and emotional distress There seems to be at least as good a justification for the concept of coordinated adrenocortical adrenomedullary responses as for coordinated adrenomedullary sympathoneural responses in stress Fainting reactions involve differential adrenomedullary hormonal vs sympathetic noradrenergic activation

Parkinson disease entails relatively selective dysfunction of the sympathetic noradrenergic system with prominent loss of noradrenergic nerves in the heart yet normal adrenomedullary function. Allostatic load links stress with degenerative diseases and Parkinson disease may be a disease of the elderly because of allostatic load.
