Adhesion Molecules in Hematology Elio Cacciola, 1996-01-01 Effective hematopoiesis occurs through a series of steps involving proliferation development and differentiation of early hematopoietic progenitor cells and ultimately leads to the release of mature cells into the peripheral blood This process is dependent on discrete cell cell and cell matrix interactions which are regulated by expression of adhesion molecules This publication highlights the critical role played by adhesion molecules in both normal and pathological hematopoiesis Several reviews focus on the regulation and expression of adhesion molecules in different types of hematological malignancies which is likely to play an important part in the anatomical distribution and progression of the disease Further topics include homing and trafficking of hemopoietic progenitor cells adhesive interactions in hemostasis as well as the roles of adhesion in cancer spread and in graft versus host disease Written by experienced investigators this compilation of reviews provides an excellent overview of the latest advances in the field and will be essential reading for hematologists oncologists internists pathologists cell and molecular biologists

Wintrobe's Clinical Hematology John P. Greer, 2009 Now available in a thoroughly revised Twelfth

Within these sections, there is a heavy focus on the morphological exam of the peripheral blood smear, bone marrow, lymph nodes, and other tissues. With the knowledge about gene therapy and immunotherapy expanding, new up-to-date information about the process and application of these therapies is included. Likewise, the editors have completely revised material on stem cell transplantation in regards to both malignant and benign disorders, graft versus host disease, and the importance of long-term follow-up of transplantation survivors.
