Arrhythmias In Heart Failure:

Heart Failure and Arrhythmias Johannes Brachmann, Rainer Dietz, Wolfgang Kübler, 2012-12-06 Heart failure is a clinical entity characterized by a certain combination of symptoms and signs. Although there is neither a definition covering all aspects of it nor any generally accepted criteria for evaluating its severity, it is the endstage of many different heart diseases. In most cases, associated with a poor prognosis, approximately 50% of the patients with advanced heart failure die from pump failure, whereas the other half succumb suddenly and unexpectedly due to ventricular tachyarrhythmias. Although impaired left ventricular function is the main risk factor, sudden death may already occur in less severe cases of heart failure. In certain cardiac diseases such as dilative cardiomyopathy, the occurrence of ventricular arrhythmias may be related directly to the underlying heart disease, as the frequency and severity of Lown classification of ventricular ectopics are not related to left ventricular impairment. Treatment of ventricular tachyarrhythmias is still an unsolved problem, especially in patients with heart failure who need it the most. The vast majority of antiarrhythmic agents are more or less negatively inotropic and may therefore substantially aggravate ventricular impairment. Nonpharmacological approaches such as the implantation of a defibrillator still require major surgery with the associated increased risk to the patient in heart failure. No agreement has yet been reached on the criteria for evaluating how effective treatment has been, either for heart failure or for ventricular tachyarrhythmias.

Arrhythmias in Heart Failure William G. Stevenson, M.D., Laurence Epstein, William Maisel, Michael Sweeney, Lynne Stevenson, 2002-05-14 The prevalence of heart failure is increasing in part due to the aging population and longer survival of patients with heart disease. As heart failure management has progressed, so has the understanding of the role of arrhythmias in heart failure and of the impact of therapies to treat them. For many clinical scenarios, a rational arrhythmia management strategy has emerged. Equally important to these strategies is the growing recognition of certain treatments that although seemingly effective at one point in time are now recognized as having greater potential for harm. This monograph provides the clinician with current fundamentals of arrhythmias in heart failure as they relate to a variety of clinical scenarios. Although a simple strategy for decision making cannot always be derived, clinicians will find the information useful for assessing and managing arrhythmias and arrhythmia risk in their patients with heart failure.

Cardiac Arrhythmias Wilbert S. Aronow, 2014-02-12 This book is useful for physicians taking care of patients with cardiac arrhythmias and includes six chapters written by experts in their field. Chapter 1 discusses basic mechanisms of cardiac arrhythmias. Chapter 2 discusses the chronobiological aspects of the impact of apnoic episodes on ventricular arrhythmias. Chapter 3 discusses navigation, detection, and tracking during cardiac ablation interventions. Chapter 4 discusses epidemiology and pathophysiology of ventricular arrhythmias in several noncardiac diseases, methods used to assess arrhythmia risk, and their association with long-term outcomes. Chapter 5 discusses the treatment of ventricular arrhythmias, including indications for implantation of an AICD for primary and for secondary prevention in patients with and without congestive heart failure.

Chapter 6 discusses surgical management of atrial fibrillation *Heart Failure and Arrhythmias* Johannes Brachmann, Rainer Dietz, Wolfgang Kübler, 1990-08-10 Heart failure is a clinical entity characterized by a certain combination of symptoms and signs Although there is neither a definition covering all aspects of it nor any generally accepted criteria for evaluating its severity it is the endstage of many different heart diseases in most cases associated with a poor prognosis Approximately 50% of the patients with advanced heart failure die from pump failure whereas the other half succumb suddenly and unexpectedly due to ventricular tachyarrhythmias Although impaired left ventricular function is the main risk factor sudden death may already occur in less severe cases of heart failure In certain cardiac diseases such as dilative cardiomyopathy the occurrence of ventricular arrhythmias may be related directly to the underlying heart disease as the frequency and severity Lown classification of ventricular ectopics are not related to left ventricular impairment Treatment of ventricular tachyarrhythmias is still an unsolved problem especially in patients with heart failure who need it the most The vast majority of antiarrhythmic agents are more or less negatively inotropic and may therefore substantially aggravate ventricular impairment Nonpharmacological approaches such as the implantation of a defibrillator still require major surgery with the associated increased risk to the patient in heart failure No agreement has yet been reached on the criteria for evaluating how effective treatment has been either for heart failure or for ventricular tachyarrhythmias *The Role of Calcium Handling in Heart Failure and Heart Failure Associated Arrhythmias* Elisabetta Cerbai, Alessandro Mugelli, Daniel M. Johnson, 2019-05-15 Under normal healthy conditions the contraction of cardiac myocytes leading to the pump function of this organ is driven by calcium dependent mechanisms Entry of calcium into the myocyte during the cardiac action potential causes activation of the ryanodine receptors and release of calcium from the sarcoplasmic reticulum This process termed calcium induced calcium release is essential for excitation contraction coupling and enables each action potential to be transduced into a mechanical event Indeed in healthy myocytes the calcium concentration in the cytosol is elevated approximately 10 fold from a resting level of 100 nM to 1 μ M This process is finely orchestrated by a number of key proteins which can be specifically regulated by various pathways depending on the oxygen demand Furthermore the specific structure of the myocyte allows certain calcium dependent processes to be compartmentalised increasing the efficiency and safety of this regulation Heart failure is a common costly and life threatening condition In 2015 for example it affected around 40 million people globally In patients with heart failure the risk of sudden cardiac death and arrhythmias increases substantially Cellular remodelling and alterations in calcium handling which appear to contribute to the arrhythmogenic burden in heart failure have been extensively reported However a number of unanswered questions remain and each new study while continuing to shed light on this subject raises additional novel questions This current compendium of articles covers a number of aspects and comprehensively reviews current knowledge and perspectives regarding the link between calcium handling arrhythmias and heart failure providing at the same time insights that may lead to novel therapeutic options for the
