Aromatic Sextet:

The Aromatic Sextet Erich Clar, 1972 **Aromatic and Heteroaromatic Chemistry** C. W. Bird, G. W. H. Cheeseman, 1974 Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research. Written by experts in their specialist fields, the series creates a unique service for the active research chemist, supplying regular critical in-depth accounts of progress in particular areas of chemistry. For over 80 years the Royal Society of Chemistry and its predecessor the Chemical Society have been publishing reports charting developments in chemistry which originally took the form of Annual Reports. However, by 1967 the whole spectrum of chemistry could no longer be contained within one volume, and the series Specialist Periodical Reports was born. The Annual Reports themselves still existed but were divided into two, and subsequently three volumes covering Inorganic, Organic, and Physical Chemistry. For more general coverage of the highlights in chemistry, they remain a must. Since that time the SPR series has altered according to the fluctuating degree of activity in various fields of chemistry. Some titles have remained unchanged, while others have altered their emphasis along with their titles; some have been combined under a new name, whereas others have had to be discontinued.

The Aromatic Sextet Erich J. Clar, 1972 *Aromaticity and Antiaromaticity* Miquel Solà, Alexander I. Boldyrev, Michal K. Cyrański, Tadeusz M. Krygowski, Gabriel Merino, 2022-10-10 Aromaticity and Antiaromaticity: A comprehensive review of the science of aromaticity as well as its evolution from benzene to atomic clusters. In *Aromaticity and Antiaromaticity: Concepts and Applications*, a team of accomplished chemists delivers a comprehensive exploration of the evolution and critical aspects of aromaticity. The book examines the new global criteria used to evaluate aromaticity, including the Nucleus Independent Chemical Shift (NICS) index and the electronic indices based on electronic properties. Additional discussions of inorganic aromatic compounds developed in this century, which give rise to new concepts like multifold aromaticity, are included. Three-dimensional aromaticity found in fullerenes and nanotubes, Möbius aromaticity present in some annulenes, and excited state aromaticity are explored as well. This volume explores the geometrical, electronic, magnetic, and thermodynamic characteristics of aromatic and antiaromatic compounds and their reactivity properties. It also provides a thorough historical overview of aromaticity as well as simple electronic and structural models. Comprehensive explorations of organic and inorganic aromatic compounds, concepts of stability and reactivity, and geometric, energetic, magnetic, and electronic criteria of descriptors of aromaticity. Practical discussions of heteroaromaticity as well as Möbius aromaticity and excited state aromaticity. In-depth examinations of sigma pi deltal and phi aromaticity. Perfect for graduate students, researchers, and academics interested in aromaticity, organometallic chemistry, and computational chemistry. *Aromaticity and Antiaromaticity: Concepts and Applications* will also earn a place in the libraries of professionals and researchers working in organic, inorganic, and physical chemistry.

Introduction to the Theory of Benzenoid Hydrocarbons Ivan Gutman, Sven J. Cyvin, 2012-12-06 In the last hundred years benzenoid hydrocarbons have constantly attracted the attention of both experimental and theoretical chemists In spite of the fact that some of the basic concepts of the theory of benzenoid hydrocarbons have their origins in the 19th and early 20th century research in this area is still in vigorous expansion The present book provides an outline of the most important current theoretical approaches to benzenoids Emphasis is laid on the recent developments of these theories which can certainly be characterized as a significant advance Emphasis is also laid on practical applications rather than on pure theory The book assumes only some elementary knowledge of organic and physical chemistry and requires no special mathematical training Therefore we hope that undergraduate students of chemistry will be able to follow the text without any difficulty Since organic and physical chemists are nowadays not properly acquainted with the modern theory of benzenoid molecules we hope that they will find this book both useful and informative Our book is also aimed at theoretical chemists especially those concerned with the topological features of organic molecules The authors are indebted to Dr WERNER SCHMIDT Ahrensburg FRG for valuable discussions One of the authors I G thanks the Royal Norwegian Council for Scientific and Industrial Research for financial support during 1988 which enabled him to stay at the University of Trondheim and write the present book Trondheim July 1989 Ivan Gutman Sven J Cyvin Contents Chapter 1 Benzenoid Hydrocarbons *Aromatic Compounds* Malcolm Sainsbury, 2016-06-24 *Aromatic Compounds* **Polycyclic Arenes and Heteroarenes** Qian Miao, 2015-12-21 The first book of its kind to focus on the chemistry of this promising class of molecules Edited by an innovator in the field who has gathered an international team of well established experts this is a comprehensive overview of the rapidly developing field of polycyclic heteroarenes specifically highlighting on their molecular design and the latest synthetic procedures as well as chemical and physical properties Each chapter is dedicated to a specific compound class the first eight covering polycyclic arenes including both planar and non planar conjugated molecules while chapters nine to twelve deal with polycyclic heteroarenes according to the heteroatoms namely N B S and P Important current and emergent applications in the field are also discussed ranging from

molecular sensors to electronic devices The result is an essential reference for researchers in synthetic and physical organic chemistry supramolecular chemistry and materials science **PAHs and Related Compounds** Alasdair N.

Neilson,2013-11-11 Environmental Chemistry is a relatively young science Interest in this subject however is growing very rapidly and although no agreement has been reached as yet about the exact content and limits of this interdisciplinary discipline there appears to be increasing interest in seeing environmental topics which are based on chemistry embodied in this subject One of the first objectives of Environmental Chemistry must be the study of the environment and of natural chemical processes which occur in the environment A major purpose of this series on Environmental Chemistry therefore is to present a reasonably uniform view of various aspects of the chemistry of the environment and chemical reactions occurring in the environment The industrial activities of man have given a new dimension to Environmental Chemistry We have now synthesized and described over five million chemical compounds and chemical industry produces about hundred and fifty million tons of synthetic chemicals annually We ship billions of tons of oil per year and through mining operations and other geophysical modifications large quantities of inorganic and organic materials are released from their natural deposits Cities and metropolitan areas of up to 15 million inhabitants produce large quantities of waste in relatively small and confined areas Much of the chemical products and waste products of modern society are released into the environment either during production storage transport use or ultimate disposal These released materials participate in natural cycles and reactions and frequently lead to interference and disturbance of natural systems **March's Advanced Organic**

Kekulé Structures in Benzenoid Hydrocarbons Sven J. Cyvin, Ivan Gutman, 2013-04-17 This text is an attempt to outline the basic facts concerning Kekulé structures in benzenoid hydrocarbons their history applications and especially enumeration We further point out the numerous and often quite remarkable connections between this topic and various parts of combinatorics and discrete mathematics Our book is primarily aimed toward organic and theoretical chemists interested in the enumeration of Kekulé structures of conjugated hydrocarbons as well as to scientists working in the field of mathematical and computational chemistry The book may be of some relevance also to mathematicians wishing to learn about contemporary applications of combinatorics graph theory and other branches of discrete mathematics In 1985 when we decided to prepare these notes for publication we expected to be able to give a complete account of all known combinatorial formulas for the number of Kekulé structures of benzenoid hydrocarbons This turned out to be a much more difficult

task than we initially realized only in 1986 some 60 new publications appeared dealing with the enumeration of Kekule structures in benzenoids and closely related topics In any event we believe that we have collected and systematized the essential part of the presently existing results In addition to this we were delighted to see that the topics to which we have been devoted in the last few years nowadays form a rapidly expanding branch of mathematical chemistry which attracts the attention of a large number of researchers both chemists and mathematicians *Concerning Amines* David
