cited references are variables attributed to texts. ... one should realize that network data are different from attributes as data. From a network perspective, for example, one may wish to focus on how the network develops structurally over time".

For performing co-citation analysis, NET file obtained for 653 articles in BibExcel is opened in Gephi. This software generates a random map which has no visible pattern, when the NET file is opened for the first time. However, different layouts can be created by using various algorithms of Gephi. In this study, we have used Force Atlas layout which is highly recommended by developers as it is easy to understand. In such networks, edges attract and nodes repulse each other. Bastian et al. (2009) noted that the values of repulsion strength, gravity, speed, node size and other characteristics can be altered manually. By using this algorithm, the nodes which are strongly connected move to the centre of the network whereas, the less connected nodes move out to the boundaries. The Force Atlas layout of 589 node citation map is shown in Fig. 5.

The Force Atlas layout of 589 node co-citation map is shown in Fig. 5. The co-cited articles are connected with each other while, the poorly connected nodes shift away from the centre. Moreover, the nodes which are isolated from rest of the network, also termed as 'outliers', are excluded for the purpose of data clustering, done in the next section. On excluding these outliers we are left with a network having 589 nodes and 1025 edges.

5.3.1. Data clustering

Data clustering is a technique that helps in grouping a set of articles (Radicechi et al., 2004; Mishra et al., 2016a,b). In a network, the nodes which represent the articles can be grouped into clusters such that the edges between the nodes of the same cluster are denser as compared to those of different clusters (Clauset et al., 2004; Leydesdorff, 2011; Radicechi et al., 2004). Blondel et al. (2008) observed that Modularity, which measures the density of links inside communities versus the links between communities, is gaining attention in the research community. In Gephi, the default modularity tool is based on Louvain algorithm. The value of modularity index varies between -1 and $+1$. Blondel et al. (2008) gave the formula for calculating modularity index:

$$Q = \frac{1}{2m} \sum_{ij} \left[A_{ij} - \frac{k_i k_j}{2m} \right] \delta (c_i, c_j) .$$

where A_{ij} represents the weight of the edge between nodes i and j , k_i is the sum of the weights of the edges attached to

node i ($k_i = \sum_j A_{ij}$), c_i is the community to which vertex i is assigned, $\delta(u, v)$ is equal to 1 if $u = v$ and 0 otherwise, and finally $m = (1/2) \sum_{ij} A_{ij}$.

On applying this algorithm to 589-node network, four major clusters were created and the modularity index was found to be 0.19. This indicates strong inter-relationships between clusters which is also clear from Fig. 6(a) and (b). This indicates a strong inter-relationship between the nodes of each cluster as well as between the nodes of different clusters.

When two or more papers are often cited together, they are likely to share same area of interest (Hjerland, 2013). Hence, a detailed analysis of papers belonging to one cluster can help in identifying the research area of that cluster. As the number of papers in each cluster is high, we considered only the top publications of each cluster which were identified on the basis of their co-citation PageRank. Table 12 shows the top publications of each cluster.

In order to find out the area of research focus of each cluster, we carefully examined the contents and research areas of the leading papers. Table 13 briefly outlines the areas of research focus for each of the four clusters. The classification of the literature presented in Table 13 exhibits that researchers belonging to clusters 1–3 have contributed by giving theoretical, conceptual and empirical studies which mainly focus on improving environmental and economic performance of supply chains. Despite the fact that both cluster 1 and 2 contribute to theory development, the focus of cluster 1 mainly lies in initial development of concepts and theories which may be more analytical in nature. It can also be observed that majority of the works in this cluster are focused on studying and exploring the concept of sustainability in supply chains. The aim of the 2nd cluster is to move ahead with well-established theories and validate them with statistically rigorous techniques. These works discuss the results of the empirical investigation that was carried out to test the proposed hypotheses.

Although 2nd and 3rd clusters overlap with empirical studies, the authors in 3rd cluster were mainly interested in developing and validating measurement models so as to find out how well the GSCM practices are being implemented in different firms. Lastly, the majority of researchers belonging to 4th cluster concentrated at designing, planning and practical applications of GSCM in different industrial sectors. It can be observed that first and second clusters are the most popular ones, whereas there is a scope of future work in cluster 3rd and 4th. Without doubt, this fourth cluster classification may guide scholars as to where to look for current research topics and future research opportunities.

6. Discussion

Our interest in undertaking the bibliometric and network analysis on GSC-PM was triggered by two facets. First, the GSCM literature is growing exponentially, but the literature focusing on the assessment of the green supply chain performance is still underdeveloped. Second, there is strong urge among developing economies for embracing green performance measures in supply chains; however, the literature focusing on developing economies is scant. To address these gaps and as an initial effort in this direction, the present study explored the use of bibliometric and network analysis to objectively evaluate the literature on GSC-PM and
