A Review of Fracture Mechanics Life Technology Philip M. Besuner, 1986 Lifetime prediction technology for structural components subjected to cyclic loads is examined The central objectives of the project are 1 to report the current state of the art and 2 recommend future development of fracture mechanics based analytical tools for modeling subcritical fatigue crack growth in structures Of special interest is the ability to apply these tools to practical engineering problems and the developmental steps necessary to bring vital technologies to this stage The authors conducted a survey of published literature and numerous discussions with experts in the field of fracture mechanics life technology One of the key points made is that fracture mechanics analyses of crack growth often involve consideration of fatigue and fracture under extreme conditions Therefore inaccuracies in predicting component lifetime will be dominated by inaccuracies in environment and fatigue crack growth relations stress intensity factor solutions and methods used to model given loads and stresses Suggestions made for reducing these inaccuracies include development of improved models of subcritical crack growth
