

96 DRINKING WATER AND HEALTH

is the product of the workshop. Because the study of the toxicity of mixtures is relatively new, the Subcommittee on Mixtures, which prepared the report, confined its considerations to a small number of issues.

APPROACHES FOR PROBLEM RESOLUTION

Several possibilities exist for attacking the problems of testing (and regulating) mixtures. Research on mechanisms could lead to theoretical modeling that would exploit data on the toxicity of single materials; that is a desirable long-term goal. In the absence of knowledge of mechanisms and of accepted models for combining the toxicities of single materials, some mixtures will have to be tested. If the numbers of such mixtures can be kept small, testing might become both operationally and economically possible.

GROUPING CHEMICALS FOR ESTIMATION OF COMBINED RISK

A prudent first step in assessing and managing the health risks associated with exposure to mixtures in drinking water is to reduce the apparent number of mixtures by developing appropriate methods for grouping the substances found in water. This report examines two such groups based on similarities of biologic effects: volatile organic chemicals (VOCs), of which several are suspected human carcinogens, and organophosphorus compounds and carbamates, which inhibit acetylcholinesterase. In addition, this report suggests some ways to make other logical classifications and thus reduce the testing needed.

Except for the trihalomethanes (a class of volatile organic chemicals that are by-products of disinfection), the EPA Office of Drinking Water has promulgated standards only for single components of drinking water. It is unlikely that each agent present in drinking water will act in biologic isolation of every other agent present. Where the mechanisms of toxicity of two or more toxicants are the same or similar, exposure to several materials, each at a below-threshold dose (i.e., a dose with a zero response), could amount to exposure to an above-threshold dose and produce a response.

EPA's general guidelines for evaluating the health risk associated with exposure to a chemical mixture recommend that, if data are not available on the complete mixture or a toxicologically similar mixture, a dose-additive method be used to define a "hazard index" (in effect, an exposure index) based on measured concentrations and reference doses. The subcommittee recommends using a modified hazard index that sums similar toxicities, incorporates multiple toxic manifestations, and suggests, under some circumstances, the use of an uncertainty factor to allow for possible synergisms.

The subcommittee reviewed earlier schemes for the arbitrary grouping of substances in its efforts to devise some classification schemes that could

National Research Council, Division on Earth and Life Studies, Board on Environmental Studies and Toxicology, Commission on Life Sciences, Committee on Risk Assessment of Hazardous Air Pollutants, 1994-01-01 The public depends on competent risk assessment from the federal government and the scientific community to grapple with the threat of pollution When risk reports turn out to be overblown or when risks are overlooked public skepticism abounds This comprehensive and readable book explores how the U S Environmental Protection Agency EPA can improve its risk assessment practices with a focus on implementation of the 1990 Clean Air Act Amendments With a wealth of detailed information pertinent examples and revealing analysis the volume explores the default option and other basic concepts It offers two views of EPA operations The first examines how EPA currently assesses exposure to hazardous air pollutants evaluates the toxicity of a substance and characterizes the risk to the public The second more holistic view explores how EPA can improve in several critical areas of risk assessment by focusing on cross cutting themes and incorporating more scientific judgment This comprehensive volume will be important to the EPA and other agencies risk managers environmental advocates scientists faculty students and concerned individuals

Issues in Potable Reuse National Research

Council, Division on Earth and Life Studies, Commission on Geosciences, Environment and Resources, Committee to Evaluate the Viability of Augmenting Potable Water Supplies with Reclaimed Water, 1998-07-23 A small but growing number of municipalities are augmenting their drinking water supplies with highly treated wastewater But some professionals in the field argue that only the purest sources should be used for drinking water Is potable reuse a viable application of reclaimed water How can individual communities effectively evaluate potable reuse programs How certain must certain be when it comes to drinking water safety *Issues in Potable Reuse* provides the best available answers to these questions Useful to scientists yet accessible to concerned lay readers this book defines important terms in the debate and provides data analysis

and examples of the experience of municipalities from San Diego to Tampa The committee explores in detail the two major types of contaminants Chemical contaminants The committee discusses how to assess toxicity reduce the input of contaminants evaluate treatment options manage the byproducts of disinfection and other issues Microbial contaminants including newly emerging waterborne pathogens The book covers methods of detection health consequences treatment and more Issues in Potable Reuse reviews the results of six health effects studies at operational or proposed reuse projects The committee discusses the utility of fish versus mammals in toxicology testing and covers issues in quality assurance

advances in microbiology molecular biology and analytical chemistry have made it timely to reassess the current paradigm of relying predominantly or exclusively on traditional bacterial indicators for all types of waterborne pathogens Nonetheless indicator approaches will still be required for the foreseeable future because it is not practical or feasible to monitor for the complete spectrum of microorganisms that may occur in water and many known pathogens are difficult to detect directly and reliably in water samples This comprehensive report recommends the development and use of a tool box approach by the U S Environmental Protection Agency and others for assessing microbial water quality in which available indicator organisms and or pathogens in some cases and detection method s are matched to the requirements of a particular application The report further recommends the use of a phased three level monitoring framework to support the selection of indicators and indicator approaches
