James, 2000-06-28 Imagine scientists controlling the transmission of certain diseases through the genetic modification of mosquitoes Eradicating harmful insects without the use of pesticides Or increasing the fertility of some insects who in turn eat harmful arthropods or even a plant pathogen Those are just a few of the real world applications of insect transgen In Situ Evaluation of Biological Hazards of Environmental Pollutants Shabeg S. Sandhu, William R. Lower, Frederick J. de Serres, William A. Suk, Raymond R. Tice, 2013-03-08 The study of the relationship between environmental pollution and human health is in its infancy The number of substances and mixtures that have been identified in uncontrolled hazardous waste sites or that have been inadvertently released into the environment is large and data on how these substances are modified as they interact with one another as they migrate through soil air and water are limited There are also limits on our understanding of how these substances may be ingested inhaled or absorbed by people The complexity of possible interactions between biological chemical and physical components in a given environment makes it virtually impossible to evaluate the potential for adverse biological effects adequately in the laboratory Other more comprehensive methods which provide realistic and interpretable results must be used Many scientists believe that humans represent the ultimate sentinel species of a toxic exposure resulting from environmental pollution however such exposures may also severely impact environmental health There exists a wide variety of organisms in the natural environment that could be used to provide an early warning for potential human health effects as well as to indicate adverse ecological effects The issue of effective utilization of sentinel species for environmental monitoring is a rapidly developing area of research which has grown in importance during the last decade
