Drug Toxicity in Embryonic Development Robert J. Kavlock, *Drug Toxicity in Embryonic Development I* Robert J. Kavlock, George P. Daston, 2012-12-06 Having received the invitation from Springer Verlag to produce a volume on drug induced birth defects for the Handbook of Experimental Pharmacology we asked ourselves what new approach could we offer that would capture the state of the science and bring a new synthesis of the information on this topic to the world's literature We chose a three pronged approach centered around those particular drugs for which we have a relatively well established basis for understanding how they exert their unwanted effects on the human embryo We then supplemented this information with a series of reviews of critical biological processes involved in the established normal developmental patterns with emphasis on what happens to the embryo when the processes are perturbed by experimental means Knowing that the search for mechanisms in teratology has often been inhibited by the lack of understanding of how normal development proceeds we also included chapters describing the amazing new discoveries related to the molecular control of normal morphogenesis for several organ systems in the hope that the experimental toxicologists and molecular biologists will begin to better appreciate each others questions and progress Several times during the last two years of developing outlines issuing invitations reviewing chapters and cajoling belated contributors we have wondered whether we made the correct decision to undertake this effort

Drug Toxicity in Embryonic Development I/II Robert J. Kavlock, George P. Daston, 1996 *Developmental Toxicology* Deborah K.

Hansen, Barbara D. Abbott, 2008-10-22 Highlighting latest advances in genetics and biochemistry the completely revised Third Edition reviews the field from basic science clinical epidemiological and regulatory perspectives Contributions from top

opinion leaders in the field bring together developments in molecular embryology and cell biology as they apply to problems in developmental toxicology. It covers testing of pharmaceutical and environmental agents and interpretation of developmental toxicology data highlighting mathematical and statistical techniques as well as the effects of toxic exposure on the functional development of various organs. The relationship between maternal and developmental toxicology is examined in addition to current techniques for studying chemical disposition, metabolism and placental transfer. Close attention is given to the regulatory aspects of testing and risk assessment. Pre and postconceptional clinical care and genetic factors in clinical developmental toxicology are also discussed. Key topics include the roles of apoptosis and signal transduction pathways in normal and abnormal development, the role of epigenetic changes in development, the role of nutrition and individual susceptibility, the utility of bioinformatics, global and targeted gene expression changes.

Drug Toxicity in Embryonic Development II Robert J. Kavlock, George P. Daston, 2011-11-23 Having received the invitation from Springer Verlag to produce a volume on drug induced birth defects for the Handbook of Experimental Pharmacology we asked ourselves what new approach could we offer that would capture the state of the science and bring a new synthesis of the information on this topic to the world's literature. We chose a three pronged approach centered around those particular drugs for which we have a relatively well established basis for understanding how they exert their unwanted effects on the human embryo. We then supplemented this information with a series of reviews of critical biological processes involved in the established normal developmental patterns with emphasis on what happens to the embryo when the processes are perturbed by experimental means. Knowing that the search for mechanisms in teratology has often been inhibited by the lack of understanding of how normal development proceeds we also included chapters describing the amazing new discoveries related to the molecular control of normal morphogenesis for several organ systems in the hope that experimental toxicologists and molecular biologists will begin to better appreciate each others questions and progress. Several times during the last two years of developing outlines, issuing invitations, reviewing chapters and cajoling belated contributors we have wondered whether we made the correct decision to undertake this effort.

Comprehensive Toxicology: Reproductive and endocrine toxicology I. Glenn Sipes, 1997. This volume in the Comprehensive Toxicology series demonstrates how the use of extremely powerful molecular and cell biology techniques has stimulated the growth of toxicology as a scientific discipline. The field of toxicology has evolved from its earlier days of in vivo and descriptive studies to focusing on mechanisms. Frequently, mechanisms require an examination at the cellular and molecular level. Molecular toxicology has opened the door to comprehending the basic mechanisms of how toxicants show their effects. The volume is a comprehensive integrated profile of the molecular effects of toxicants and the molecular mechanisms involved in producing cellular and tissue injury.
