Air Pollution Handbook Of Environmental Chemistry:

The Handbook of Environmental Chemistry , **The Handbook of Environmental Chemistry** O. Hutzinger, 1989

Indoor Air Pollution Peter Pluschke, 2004-09-27 Indoor Air Pollution has become a major topic in environmental research and health. Most people spend more than 80% of their time in buildings and are exposed to a broad range of pollutants from indoor sources such as building materials, furniture, carpets and textiles, heating and cooking, household and consumer products etc. The volume provides a comprehensive review of the major indoor air pollutants: volatile organic compounds, biocides, indoor particles and fibres, combustion products and micro organisms and their metabolites. Sources and sinks of air pollutants in indoor environments and their chemistry are distinctly different from ambient air pollution, even though the latter may influence indoor air quality. Adsorption and desorption processes, the pollutant source dynamics, gas phase reactions and kinetics, including the fate and final chemical destiny of chemically unstable intermediate compounds, are topics of scientific research as well as the evaluation of their sensory impact and irritation potential. Guidelines for assessing indoor pollution and a broad range of analytical methods have been recently developed and are reviewed by internationally renowned scientists. The specific characteristics of indoor air pollution in developing countries, due to the widespread use of open fires for cooking, heating and lighting, are analysed as well as the Chinese strategies to address the growing pollution problems by air pollution in its modern building stock.

Air Pollution , 2013-06-05 Environmental Chemistry is a relatively young science. Interest in this subject, however, is growing very rapidly, and although no agreement has been reached as yet about the exact content and limits of this interdisciplinary subject, there appears to be increasing interest in seeing environmental topics which are based on chemistry embodied in this subject. One of the first objectives of Environmental Chemistry must be the study of the environment and of natural chemical processes which occur in the environment. A major purpose of this series on Environmental Chemistry, therefore, is to present a reasonably uniform view of various aspects of the chemistry of the environment and chemical reactions occurring in the environment. The industrial activities of man have given a new dimension to Environmental Chemistry. We have now synthesized and described over five million chemical compounds, and chemical industry produces about one hundred and fifty million tons of synthetic chemicals annually. We ship billions of tons of oil per year, and through mining operations and other geophysical modifications, large quantities of inorganic and organic materials are released from their natural deposits. Cities and metropolitan areas of up to 15 million inhabitants produce large quantities of waste in relatively small and confined areas. Much of the chemical products and waste products of modern society are released into the environment either during production, storage, transport, use, or ultimate disposal. These released materials participate in natural cycles and reactions and frequently lead to interference and disturbance of natural systems.

 Environmental Chemistry, Eighth Edition Stanley E. Manahan,2004-08-26 Environmental Chemistry Eighth Edition builds
on the same organizational structure validated in previous editions to systematically develop the principles tools and
techniques of environmental chemistry to provide students and professionals with a clear understanding of the science and
its applications Revised and updated since the publication of the best selling Seventh Edition this text continues to emphasize
the major concepts essential to the practice of environmental science technology and chemistry while introducing the newest
innovations to the field The author provides clear explanations to important concepts such as the anthrosphere industrial
ecosystems geochemistry aquatic chemistry and atmospheric chemistry including the study of ozone depleting
chlorofluorocarbons The subject of industrial chemistry and energy resources is supported by pertinent topics in recycling
and hazardous waste Several chapters review environmental biochemistry and toxicology and the final chapters describe
analytical methods for measuring chemical and biological waste New features in this edition include enhanced coverage of
chemical fate and transport industrial ecology particularly how it is integrated with green chemistry conservation principles
