Airborne Microparticle Bits Physics Chemistry Optics And Transport Phenomena:

The Airborne Microparticle E. James Davis, Gustav Schweiger, 2012-12-06 It has been thirty years since one of the authors EJD began a collaboration with Professor Milton Kerker at Clarkson University in Potsdam New York using light scattering methods to study aerosol processes The development of a relatively short lived commercial particle levitator based on a modification of the Millikan oil drop experiment attracted their attention and led the author to the study of single droplets and solid microparticles by levitation methods The early work on measurements of droplet evaporation rates using light scattering techniques to determine the size slowly expanded and diversified as better instrumentation was developed and faster computers made it possible to perform Mie theory light scattering calculations with ease Several milestones can be identified in the progress of single microparticle studies The first is the introduction of the electrodynamic balance which provided more robust trapping of a particle The electrodynamic levitator which has played an important role in atomic and molecular ion spectroscopy leading to the Nobel Prize in Physics in 1989 shared by Wolfgang Paul of Bonn University and Hans Dehmelt of the University of Washington was easily adapted to trap microparticles Simultaneously improvements in detectors for acquiring and storing light scattering data and theoretical and experimental studies of the interesting optical properties of microspheres especially the work on morphology dependent resonances by Arthur Ashkin at the Bell Laboratories Richard Chang from Yale University and Tony Campillo from the Naval Research Laboratories in Washington D C

The Airborne Microparticle E. James Davis, Gustav Schweiger, 2002 This book is an extensive yet self contained reference of single microparticle studies as they have been performed for many years by the authors With the range of theoretical and experimental tools available it has become possible to use the many unique properties of droplets and small particles to investigate phenomena as diverse as linear and nonlinear optics solution thermodynamics gas solid and gas liquid chemical reactions transport properties such as gas phase diffusion coefficients rate processes in the continuum and non continuum regimes trace gas uptake by aerosol droplets related to atmospheric chemistry and ozone depletion phoretic phenomena Raman spectroscopy particle charge evaporation and condensation processes Throughout the book the main concern of the authors was to provide the reader with a visualization of the significance and application of the theory by experimental results

Forthcoming Books Rose Arny, 2002 [Particle Packing and Transport Phenomena](#) Aibing Yu, 2016-08-12 The aim of this handbook is to provide a comprehensive summary of the field of Particle Science and Technology which includes most updated research findings and their applications in different industries It is hoped that the consolidated knowledge described by this handbook will inspire more innovative ideas to bring the field forward The size of the particles may range from nanometer scale as in pigments or aerosols to that of mined or quarried materials The handbook will cover the topics ranging from the formation and synthesis packing and flow and application of these particles Each part is explored in great details in different sections and chapters it is written by a pool of international well known

scholars as well as industrial experts The handbook fully reflects the state of the art in Particle Science and Technology

Aerosol Microphysics II H.P. Baltes,1982-06 Aerosols which are gas phase dispersions of particulate matter draw upon and contribute to multidisciplinary work in technology and the natural sciences As has been true throughout the history of science with other fields of interest whose underlying disciplinary structure was either unclear or insufficiently well developed to contribute effectively to those fields aerosol science has developed its own methods and lore somewhat sequestered from the main lines of contemporary physical thought Indeed this independent development is the essential step in which systematic or phenomenological descriptions are evolved with validity of sufficient generality to suggest the potential for development of a physically rigorous and generalizable body of knowledge At the same time the field has stimulated many questions which limited to its own resources are hopelessly beyond explanation As Kuhn pointed out in *The Structure of Scientific Revolution* 2nd enlarged edition University of Chicago Press Chicago 1970 Chapter II and Postscript 1969 this is a very common juncture in the development of a science In brief the transition from this earlier stage to the mature stage of the science involves a general recognition and agreement of what the foundations of the field consist of By this critical step a field settles upon a common language which is well defined rather than the ambiguous and often undefined descriptors prevalent at the earlier stage *Analysis of Airborne Particles by Physical Methods* Malissa Hanns,2018-01-18 An accurate and complete characterization of the solid pollutants in air taking into account the physiochemical and technological data available concerning the origin transformation and the effects of dust is a synoptic approach known as SISintegrated dust analysis and is the underlying concept of this book *The Airborne Microparticle* ,2002

Techniques for Mass Determination of Airborne Micro-Particles in an Optical Dipole Force Trap Gehrig Michael Isaac Carlse,2020 We present the development of a new technique for rapidly measuring the masses of airborne particles confined in free space optical dipole force traps This technique employs an ultrafast CMOS sensor with a wide field of view to image the real time motion of trapped particles on timescales in which diffusive Brownian motion predicted by Einstein makes a transition to ballistic motion The technique relies on direct imaging of drop and restore experiments without the need for a vacuum environment In these drop and restore experiments the trapping light is rapidly shuttered with an acousto optic modulator causing the particle to be released from and subsequently recaptured by the trapping force The trajectories from the falls and restorations are combined to infer the particle mass which we also corroborate using an analysis of position autocorrelation functions of the trapped particles Using the drop and restore technique we report a statistical uncertainty of less than 2% for masses on the order of 510 ± 14 kg using a data acquisition time of approximately 90 seconds We also show that the measurement of a ballistic mean squared displacement can be used for a preliminary estimate of the mass of a trapped micro particle Furthermore we show that even the capacity to detect the timescale at which the transition to ballistic motion occurs in combination with a measurement of particle size can provide a similar mass estimate consistent

with the more rigorous mass determinations developed in this thesis Ultimately the methods presented here constitute simple effective and competitive alternatives for characterizing trapped particles and measuring their masses in comparison with more elaborate standard techniques The Airborne Microparticle ,2002
