interrelated goals by the use of adaptability Coverage includes reconfigurable systems dynamic optimization techniques such as binary translation and trace reuse new memory architectures including homogeneous and heterogeneous multiprocessor systems communication issues and NOCs fault tolerance against fabrication defects and soft errors and finally how one can combine several of these techniques together to achieve higher levels of performance and adaptability The discussion also includes how to employ specialized software to improve this new adaptive system and how this new kind of software must be designed and programmed

Dynamic Reconfigurable Architectures and Transparent Optimization Techniques

Antonio Carlos Schneider Beck Fl.,Luigi Carro,2010-03-10 Dynamic Reconfigurable Architectures and Transparent Optimization Techniques presents a detailed study on new techniques to cope with the aforementioned limitations First characteristics of reconfigurable systems are discussed in details and a large number of case studies is shown Then a detailed analysis of several benchmarks demonstrates that such architectures need to attack a diverse range of applications with very different behaviours besides supporting code compatibility This requires the use of dynamic optimization techniques such as Binary Translation and Trace reuse Finally works that combine both reconfigurable systems and dynamic techniques are discussed and a quantitative analysis of one them the DIM architecture is presented
