Cracking The Genome Inside The Race To Unlock Human Dna:

Cracking the Genome Kevin Davies, 2001-01-05 In 1953 James Watson and Francis Crick discovered the double helix structure of DNA. The discovery was a profound Nobel Prize winning moment in the history of genetics but it did not decipher the messages on the twisted ladderlike strands within our cells. No one knew what the human genome sequence actually was. No one had cracked the code of life. Now at the beginning of a new millennium that code has been cracked. Kevin Davies, founding editor of the leading journal in the field *Nature Genetics*, has relentlessly followed the story as it unfolded week by week for ten years. Here for the first time in rich human scientific and financial detail is the dramatic story of one of the greatest scientific feats ever accomplished: the mapping of the human genome. In 1990 the U.S. government approved a 15 year, 3 billion plan to launch the Human Genome Project whose goal was to sequence the 3 billion letters of human DNA. At the helm of the project was James Watson who resigned after only a couple of years following a feud with National Institutes of Health (NIH) Director Bernadine Healy over gene patenting. His successor was the brilliant young medical geneticist Francis Collins who had made his name discovering the gene for cystic fibrosis. As Davies reports, Collins is a devout Christian who has traveled to Africa to work in a missionary hospital. He believes the human genome sequence is the language of God. Just as Collins became project director, J. Craig Venter, a maverick DNA sequencer and Vietnam veteran, was leaving the NIH to start his own private research institute. Venter had developed a simple shotgun strategy for sequencing DNA and his fame skyrocketed when his new institute proved his sequencing system worked by becoming the first to sequence the entire genome of a microorganism. Only 3 percent of the human genome had been sequenced by early 1998, the public project's halfway point. That same year Venter was approached by PE Corporation to launch a private human genome project. He stunned the world when he announced the formation of a new company to sequence the human genome in a mere three years for 300 million. A war of words broke out between public and private researchers. Undeterred, Venter built Celera Genomics with the motto "Speed matters. Discovery can't wait" and an 80 million supercomputer. While the insults intensified, Celera's stock price soared, tumbled, and soared again. Negotiations for cooperation between the public and private institutes began only to fall apart in acrimony. Then in the spring of 2000, President Clinton stepped in, telling his science adviser to restart negotiations. History was about to be made. Davies captures the drama of this momentous achievement, drawing on his own genetics expertise and interviews with key scientists including Venter and Collins, as well as Eric Lander, an MIT computer wizard who refers to the public genome project as the forces of good. Kari Stefansson, the genetics entrepreneur who is remaking Iceland's economy, and John Sulston, chief of the UK genome project who led the charge against gene patenting, are also featured. Davies has visited geneticists around the world to illustrate a vast international enterprise working on the frontier of human knowledge. *Cracking the Genome* is the definitive account of how the code that holds the answers to the origin of life, the evolution of humanity, and the future of medicine was broken. *Welcome to the Genome* Robert DeSalle, Michael

The Black Box of Biology Michel Morange,2020-06-09 In this masterful account a historian of science surveys the molecular biology revolution its origin and continuing impact Since the 1930s a molecular vision has been transforming biology Michel Morange provides an incisive and overarching history of this transformation from the early attempts to explain organisms by the structure of their chemical components to the birth and consolidation of genetics to the latest technologies and discoveries enabled by the new science of life Morange revisits A History of Molecular Biology and offers new insights from the past twenty years into his analysis The Black Box of Biology shows that what led to the incredible transformation of biology was not a simple accumulation of new results but the molecularization of a large part of biology In fact Morange argues the greatest biological achievements of the past few decades should still be understood within the molecular paradigm What has happened is not the displacement of molecular biology by other techniques and avenues of research but rather the fusion of molecular principles and concepts with those of other disciplines including genetics physics structural chemistry and computational biology This has produced decisive changes including the discoveries of regulatory RNAs the development of massive scientific programs such as human genome

Machine to Make a Future Paul Rabinow, Talia Dan-Cohen, 2013-10-31 A Machine to Make a Future represents a remarkably original look at the present and possible future of biotechnology research in the wake of the mapping of the human genome. The central tenet of Celera Diagnostics, the California biotech company whose formative work during 2003 is the focus of the book, is that the emergent knowledge about the genome with its profound implications for human health can now be turned into a powerful diagnostic apparatus, one that will yield breakthrough diagnostic and therapeutic products and potentially profit Celera's efforts assuming they succeed may fundamentally reshape the fabric of how health and health care are understood, practiced, and managed. Presenting a series of interviews with all of the key players in Celera Diagnostics, Paul Rabinow and Talia Dan-Cohen open a fascinating window on the complexity of corporate scientific innovation. This marks a radical departure from other books on the biotech industry by chronicling the vicissitudes of a project during a finite time period in the words of the actors themselves. Ultimately, the authors conclude Celera Diagnostics is engaged in a future characterized not by geniuses and their celebrated discoveries but by a largely anonymous and widely distributed profusion of data and results, a machine to make a future. In their new afterword, Rabinow and Dan-Cohen revisit Celera Diagnostics as its mighty machine grinds along, wondering along with the scientists what constitutes success and what constitutes failure. The pathos of the situation turns on how one poses the question as much as how one answers it. **The Scientific Life**

Steven Shapin, 2009-08-01 Who are scientists? What kind of people are they? What capacities and virtues are thought to stand behind their considerable authority? They are experts, indeed, highly respected experts authorized to describe and interpret the natural world and widely trusted to help transform knowledge into power and profit. But are they morally different from other people? *The Scientific Life* is historian Steven Shapin's story about who scientists are, who we think they are, and why our sensibilities about such things matter. Conventional wisdom has long held that scientists are neither better nor worse than anyone else; that personal virtue does not necessarily accompany technical expertise and that scientific practice is profoundly impersonal. Shapin, however, here shows how the uncertainties attending scientific research make the virtues of individual researchers intrinsic to scientific work. From the early twentieth-century origins of corporate research laboratories to the high-flying scientific entrepreneurship of the present, Shapin argues that the radical uncertainties of much contemporary science have made personal virtues more central to its practice than ever before, and he also reveals how radically novel aspects of late modern science have unexpectedly deep historical roots. His elegantly conceived history of the scientific career and character ultimately encourages us to reconsider the very nature of the technical and moral worlds in which we now live. Building on the insights of Shapin's last three influential books featuring an utterly fascinating cast of characters and brimming with bold and original claims, *The Scientific Life* is essential reading for anyone wanting to reflect on late modern American culture and how it has been shaped. *NINDS at 50* Dr. Lewis P. ancient Egyptians and examines the extraterrestrial energy technologies used to move the pyramids massive stone blocks methods later rediscovered by Nikola Tesla and the builder of Coral Castle Edward Leedskalnin He details how an advanced race implanted the basic genome on Earth as well as genetically engineered the human race and shows how our spectrum of blood types supports the theory of panspermia while directly contradicting the conventional out of Africa theory of evolution Investigating how the extraterrestrial agency behind the origin of civilization is still working behind the scenes today the author examines the strongest modern UFO accounts including the Russian Roswell case and the suppressed UFO sightings of NASA astronauts He shows that this advanced ET civilization is not an alien race in the way we normally think of aliens they are our ancestors and as human as we are **Feminist Judgments: Health Law Rewritten** Seema
