Handbook of Lipid Bilayers, Second Edition Derek

Marsh,2013-02-15 Now in its second edition the Handbook of Lipid Bilayers is a groundbreaking work that remains the field's definitive text and only comprehensive source for primary physicochemical data relating to phospholipid bilayers. Along with basic thermodynamic data coverage includes both dynamic and structural properties of phospholipid bilayers. It is an indispensable reference for users of bilayer model membranes and liposome delivery systems and for those interested in the biophysics of membrane structure. Each chapter in the second edition contains considerable amounts of explanation and elaboration including in many cases extensive analysis of structural connections between the data. New in the Second Edition: Chapters on crystal structures of phospholipids include new structures and more comprehensive data on bond lengths, bond angles, and torsion angles, and all coordinates are Cartesian. Wide angle data is indexed whenever possible to characterize chain packing modes in gel and crystalline lamellar phases. Low angle data are analyzed in terms of the lipid and water thicknesses. Headgroup separations in electron density profiles for phospholipids are included, and a separate section is devoted to the in depth analysis of electron density profiles that provides the most detailed structural information on fluid lamellar phases. Phase diagrams of phospholipid mixtures are vastly expanded and have been redrawn in standardized format to aid intercomparison. Cholesterol including ternary systems is now featured. New sections on titration calorimetry and much extended data on the temperature dependence of transfer rates. The greatly expanded chapter on bilayer bilayer interactions features new and detailed information on the components of interbilayer pressures. *The Lipid Handbook, Second Edition*

Frank D. Gunstone, John L. Harwood, Fred B. Padley, 1994-07-21 A great deal of research has been carried out on this important class of compounds in the last ten years. To ensure that scientists are kept up to date the editors of the First Edition of The Lipid Handbook have completely reviewed and extensively revised their highly successful original work. The Lipid Handbook Second Edition is an indispensable resource for anyone working with oils, fats, and related substances.

Structure and Dynamics of Membranes R. Lipowsky, E. Sackmann, 1995-06-15 The first volume of the Handbook deals with the amazing world of biomembranes and lipid bilayers Part A describes all aspects related to the morphology of these membranes beginning with the complex architecture of biomembranes continues with a description of the bizarre morphology of lipid bilayers and concludes with technological applications of these membranes The first two chapters deal with biomembranes providing an introduction to the membranes of eucaryotes and a description of the evolution of membranes The following chapters are concerned with different aspects of lipids including the physical properties of model membranes composed of lipid protein mixtures lateral phase separation of lipids and proteins and measurement of lipid protein bilayer diffusion Other chapters deal with the flexibility of fluid bilayers the closure of bilayers into vesicles which attain a large variety of different shapes and applications of lipid vesicles and liposomes Part B covers membrane adhesion membrane fusion and the interaction of biomembranes with polymer networks such as the cytoskeleton The first two chapters of this part discuss the generic interactions of membranes from the conceptual point of view The following two chapters summarize the experimental work on two different bilayer systems The next chapter deals with the process of contact formation focal bounding and macroscopic contacts between cells The cytoskeleton within eucaryotic cells consists of a network of relatively stiff filaments of which three different types of filaments have been identified As explained in the next chapter much has been recently learned about the interaction of these filaments with the cell membrane The final two chapters deal with membrane fusion

Bilayer Lipid Membranes. Structure and Mechanical Properties Tibor Hianik, Victor Ivanovich Passechnik, 1995-08-31 In *Bilayer Lipid Membranes Structure and Mechanical Properties* the authors use new methods of measurement which they have themselves developed to present an analysis of the relation between membrane structure and viscoelastic properties in particular in the transversal direction Hianik and Passechnik's approach is fundamentally different from the usual one in that they analyze lipid bilayer dynamics during various modes of deformation arriving at a new three layer model that accounts for the great heterogeneity of biomembranes The macroscopic parameters of membranes have been measured using a wide variety of methods leading to a discussion of the correlations between the parameters There is also an extensive discussion of the dynamic changes in mechanical properties of lipid bilayers in the course of conformational transition of integral proteins During the conformational changes of proteins the structure of a

bilayer undergoes a transition reaching a new stable membrane state The book is the first to present a comprehensive analysis of long distance interaction in lipid bilayers and of molecular mechanisms of mechanoreception Audience Scientists and graduate students working in biophysics membranology physiology medicine pharmacology bioelectronics electrochemistry and colloid chemistry *Thermal Biophysics of Membranes* Thomas Heimburg, 2008-02-08 An overview of recent experimental and theoretical developments in the field of the physics of membranes including new insights from the past decade The author uses classical thermal physics and physical chemistry to explain our current understanding of the membrane He looks at domain and raft formation and discusses it in the context of thermal fluctuations that express themselves in heat capacity and elastic constants Further topics are lipid protein interactions protein binding and the effect of sterols and anesthetics Many seemingly unrelated properties of membranes are shown to be intimately intertwined leading for instance to a coupling between membrane state domain formation and vesicular shape This also applies to non equilibrium phenomena like the propagation of density pulses during nerve activity Also included is a discussion of the application of computer simulations on membranes For both students and researchers of biophysics biochemistry physical chemistry and soft matter physics [National Library of Medicine Current Catalog](#) National Library of Medicine (U.S.), 1989

Lipid Polymorphism and Membrane Properties, 1997-10-02 The major lipid components of biological membranes can undergo many diverse and fascinating morphological rearrangements Studies of these diverse phases and the manner in which they are formed tends to alter the properties of ordinary bilayer membranes This book examines the structural and biological roles of lipids forming non lamellar structures Key Features Characterization of non lamellar structures Protein activity and membrane properties Analysis of membrane fusion Affect of non lamellar forming lipids on biological systems

[Membrane Dynamics and Domains](#) Peter J. Quinn, 2013-06-29 The fluid mosaic model of membrane structure formulated by Singer and Nicolson in the early 1970s has proven to be a durable concept in terms of the principles governing the organization of the constituent lipids and proteins During the past 30 or so years a great deal of information has accumulated on the composition of various cell membranes and how this is related to the different functions that membranes perform Nevertheless the task of explaining particular functions at the molecular level has been hampered by lack of structural detail at the atomic level The reason for this is primarily the difficulty of crystallizing membrane proteins which require strategies that differ from those used to crystallize soluble proteins The unique exception is bacteriorhodopsin of the purple membrane of *Halobacterium halobium* which is interpolated into a membrane that is neither fluid nor in a mosaic configuration To date only 50 or so membrane proteins have been characterised to atomic resolution by diffraction methods in contrast to the vast data accumulated on soluble proteins Another factor that has been difficult to explain is the reason why the lipid complement of membranes is often extremely complex Many hundreds of different molecular species of lipid can be identified in some membranes Remarkably the particular composition of each membrane appears to be maintained within relatively narrow

limits and its identity distinguished from other morphologically distinct membranes *Current Catalog* National Library of Medicine (U.S.), First multi year cumulation covers six years 1965 70
