Ordered mesoporous silica COK-12: mesoscale tailoring, upscaling, continuous synthesis and application in the oxidative coupling of methane Colmenares, Maria, 2018-07-19 Ordered mesoporous silica OMS materials are a family of silica nanomaterials with pores ranging in size from 2 to 50 nm which are arranged periodically within the silica matrix They have expanding applications in various fields of research such as drug delivery adsorption separation and catalysis COK 12 is an OMS produced by the soft templating method using the block copolymer P123 as a structure directing agent The synthesis takes place at room temperature under mild reaction conditions In comparison with the most widely known OMS the synthesis of COK 12 is more time efficient inexpensive and environmentally friendly yielding a material analogous to the well known SBA 15 This thesis encompasses investigations regarding the production of the ordered mesoporous silica material OMS known as COK 12 in terms of upscaling of the synthesis and tailoring of the size and shape of its characteristic hexagonal pore structure Batch upscaling of the synthesis yielded a material with nearly identical properties to that of the original COK 12 Upscaling of the COK 12 synthesis was also studied in continuous mode The installation and operation of a continuous COK 12 production unit was carried out with the aim to determine the possibility of large scale production of COK 12 with consistent material properties COK 12 was produced in continuous mode by varying the time of aging of the COK 12 slurry and the flow rate of the feed streams yielding materials with properties nearly identical to those of the original COK 12 COK 12 was used as a support for the Na₂WO₄ Mn SiO₂ catalyst for the oxidative coupling of methane reaction in various forms powder granular produced by pressing and monolithic showing promising results comparable to the enhanced activity of the catalyst supported on the SBA 15 The advantage of using COK 12 over other OMS materials is that the facile nature of COK 12 synthesis makes it a viable

candidate for industrial production of the Na_2WO_4 Mn SiO_2 catalyst if paired with appropriate pelletizing and preparation method. The introduction of hexane and polypropylene glycol PPG as micellar swelling agents into the original COK 12 synthesis was studied in order to tailor the mesoporous structure of the system. Hexane was used as a micelle expander and as an agent to produce silica mesocellular foams with ink bottle shaped pores with a larger diameter than that of the original COK 12. By adding PPG into the synthesis the shift of the mesostructure of COK 12 from 2D hexagonal to a multilamellar vesicular configuration was studied resulting in the progressive formation of this type of material with increasing concentration of PPG. The flexibility of the COK 12 synthesis in terms of upscaling and tailoring of the mesostructure was examined throughout this work with an aim to contribute to the existing and expanding knowledge regarding more versatile sustainable and possibly industrial OMS production.

Ordered Mesoporous Silica OMS gehört zu der Familie der Silica Nanomaterialien mit periodisch angeordneten Mesoporen im Größenbereich zwischen 2 und 50 nm. Diese werden zunehmend in unterschiedlichen Forschungsfeldern wie Medikamentenfreisetzung, Adsorption, Separation und Katalyse eingesetzt. COK 12 ist ein OMS, das über eine Soft Templating Methode unter Nutzung des Blockcopolymers P123 als strukturbestimmenden Zusatz erzeugt wird. Die Synthese erfolgt bei Raumtemperatur unter milden Reaktionsbedingungen. Im Vergleich zu den am weitesten bekannten OMS Materialien ist die Synthese von COK 12 zeiteffizient, günstig und umweltfreundlich. Dabei wird ein OMS Material analog zu dem bereits etablierten SBA 15 erzeugt. Die vorliegende Dissertation umfasst die Synthese eines als COK 12 bekannten OMS Materials, dem Scale Up der Synthese sowie die Anpassung und Modifizierung der ursprünglich hexagonal angeordneten Mesoporen bezüglich Porengrößen und Porenform. Das diskontinuierliche Scale Up im Batchprozess führt zu nahezu identischen Materialeigenschaften im Vergleich zu dem ursprünglichen COK 12. Ein Scale Up der COK 12 Synthese wurde zusätzlich im kontinuierlichen Prozess erprobt. Dessen Installation und Operation wurde mit dem Ziel durchgeführt, um die Möglichkeit einer Produktion von großen Mengen an COK 12 mit einheitlichen Materialeigenschaften zu validieren. Durch eine Variation der Alterungszeit, als auch der Fließrate der Lösungen, konnte COK 12 im kontinuierlichen Prozess mit nahezu identischen Eigenschaften wie das ursprüngliche COK 12 erzeugt werden. COK 12 wurde erfolgreich in verschiedenen Formen: Pulver, Pressgranulate und Monolithe als Trägermaterial für Na_2WO_4 Mn SiO_2 Katalysatoren für die oxidative Kopplung von Methan eingesetzt. Die resultierenden Aktivitäten sind vergleichbar mit denen des auf SBA 15 geträgerten Katalysators. Der Vorteil der Nutzung von COK 12 im Vergleich zu anderen OMS Materialien liegt in der vergleichsweise simplen COK 12 Synthese, weshalb es ein interessanter Kandidat für eine mögliche industrielle Produktion des Na_2WO_4 Mn SiO_2 Katalysators ist, wenn geeignete Pelletierungs- und Herstellungsmethoden angewendet werden. Die Zugabe von Hexan und Polypropylenglykol PPG zur Aufweitung der Mizellen in der ursprünglichen COK 12 Synthese wurde untersucht, um die mesoporöse Struktur des Systems zu variieren. Hexan wurde eingesetzt zur Aufweitung der Mizellen und als Hilfsmittel zur Produktion mesozellulärer Silica Schäume mit ink-bottle-förmigen Poren sowie vergrößertem

Porendurchmesser im Vergleich zu denen des ursprünglichen COK 12. Durch die Zugabe von PPG in die Synthese verändert sich die Mesoporenstruktur der ursprünglichen hexagonalen 2D Struktur zu einer multilamellaren vesikulären Anordnung, die mit zunehmender PPG Konzentration verstärkt wird. Die Flexibilität der COK 12 Synthese wurde in dieser Arbeit in Bezug auf ein Scale Up und eine Porenmodifikation weitreichend untersucht mit dem Ziel, das existierende Wissen in Bezug auf eine vielseitige nachhaltige sowie eine potentielle Industrieproduktion der COK 12 Synthese zu entwickeln.

Liquid Chromatography of Synthetic Polymers Muhammad Imran Malik, Dusan Berek, 2023-10-02. This book elucidates the peculiar phenomenon of entropy enthalpy compensation that takes place in high performance liquid chromatography (HPLC) of polymers. Numerous publications, including some books, are devoted to molecular characterization of synthetic polymers, materials presently produced in large and steadily growing quantities applying methods of HPLC. A knowledge of the molecular characteristics of polymers is indispensable not only for their proper applications but also for their recycling and remediation. Gyroid Optical Metamaterials James A. Dolan, 2018-11-04 This thesis explores the fabrication of gyroid forming block copolymer templates and the optical properties of the resulting gyroid optical metamaterials significantly contributing to our understanding of both It demonstrates solvent vapour annealing to improve the long range order of the templates and investigates the unique crystallisation behaviour of their semicrystalline block Furthermore it shows that gyroid optical metamaterials that exhibit only short range order are optically equivalent to nanoporous gold and that the anomalous linear dichroism of gyroid optical metamaterials with long range order is the result of the surface termination of the bulk gyroid morphology Optical metamaterials are artificially engineered materials that by virtue of their structure rather than their chemistry may exhibit various optical properties not otherwise encountered in nature e g a negative refractive index However these structures must be significantly smaller than the wavelength of visible light and are therefore challenging to fabricate using traditional top down techniques Instead a bottom up approach can be used whereby optical metamaterials are fabricated via templates created by the self assembly of block copolymers One such morphology is the gyroid a chiral continuous and triply periodic cubic network found in a range of natural and synthetic self assembled systems
