Deductive and Object-oriented Databases C. Delobel, Michael Kifer, Yoshifumi Masunaga, 1991 This volume is the proceedings of the Second International Conference on Deductive and Object Oriented Databases DOOD During the last decade deductive and object oriented systems have received a great deal of attention but for the most part these two fields were evolving independently of each other Today there is a large body of work suggesting that the deductive and object oriented paradigms complement each other The object oriented paradigm is characterized by its view of the data whereby information is grouped around objects with complex internal structure accessed via methods The declarative paradigm is centered around the idea that data manipulation must be done through a declarative logic based language It is hoped that these two aspects brought together in one system will provide an integrated framework for a new database technology The DOOD conference brings together researchers and developers in the fields of deductive and object oriented databases to stimulate technical discussion and accelerate the integration of the two technologies This volume contains 28 contributed papers selected from 98 submissions and two invited papers by world renowned researchers **Deductive and**

**Advances in Databases** Michael F. Worboys, Anna F. Grundy, 1993-06-23 This volume contains the proceedings of the eleventh British National Conference on Databases held at Keele University England A dominant theme in the volume is the provision of the means to enhance the capabilities of databases to handle information that has a rich semantic structure A major research question is how to achieve such a semantic scale up without sacrificing performance There are currently two main paradigms within which it is possible to propose answers to this question deduction oriented and object oriented Both paradigms are well represented in this collection with the balance in the direction of the deductive approach which is followed by both the invited papers by Michael Freeston from the European Computer Industry Research Centre in Munich and Carlo Zaniolo from the University of California at Los Angeles In addition the volume contains 13 full papers selected from a total of 36 submissions **Proceedings of the 1990 ACM SIGMOD International Conference on Management**

Vossen, 2003-06-29 With the development of the World Wide Web data management problems have branched out from the traditional framework in which tabular data is processed under the strict control of an application and address today the rich variety of information that is found on the Web considering a variety of environments under which such data can be

searched classified and processed Database systems are coming forward today in a new role as the primary backend for the information provided on the Web Most of today's Web accesses trigger some form of content generation from a database while electronic commerce often triggers intensive DBMS based applications The research community has begun to revise data models query languages data integration techniques dexterous query processing algorithms and transaction concepts in order to cope with the characteristics and scale of the data on the Web New problems have been identified among them goal oriented information gathering management of semi structured data or database style query languages for Web data to name just a few The International Workshop on the Web and Databases WebDB is a series of workshops intended to bring together researchers interested in the interaction between databases and the Web This year's WebDB 2000 was the third in the series and was held in Dallas Texas in conjunction with the ACM SIGMOD International Conference on Management of Data

Fully Integrated Data Environments Malcolm P. Atkinson, Ray Welland, 2012-12-06 Research into Fully Integrated Data Environments FIDE has the goal of substantially improving the quality of application systems while reducing the cost of building and maintaining them Application systems invariably involve the long term storage of data over months or years Much unnecessary complexity obstructs the construction of these systems when conventional databases file systems operating systems communication systems and programming languages are used This complexity limits the sophistication of the systems that can be built generates operational and usability problems and deleteriously impacts both reliability and performance This book reports on the work of researchers in the Esprit FIDE projects to design and develop a new integrated environment to support the construction and operation of such persistent application systems It reports on the principles they employed to design it the prototypes they built to test it and their experience using it *Rules in Database Systems* Norman W. Paton, M. Howard Williams, 2012-12-06 This book is the proceedings of a workshop held at Heriot Watt University in Edinburgh in August 1993 The central theme of the workshop was rules in database systems and the papers presented covered a range of different aspects of database rule systems These aspects are reflected in the sessions of the workshop which are the same as the sections in this proceedings Active Databases Architectures Incorporating Temporal Rules Rules and Transactions Analysis and Debugging of Active Rules Integrating Graphs Objects with Deduction Integrating Deductive and Active Rules Integrity Constraints Deductive Databases The incorporation of rules into database systems is an important area of research as it is a major component in the integration of behavioural information with the structural data with which commercial databases have traditionally been associated This integration of the behavioural aspects of an application with the data to which it applies in database systems leads to more straightforward application development and more efficient processing of data Many novel applications seem to need database systems in which structural and behavioural information are fully integrated Rules are only one means of expressing behavioural information but it is clear that different types of rule can be used to capture directly different properties of an application which are cumbersome to

support using conventional database architectures In recent years there has been a surge of research activity focusing upon active database systems and this volume opens with a collection of papers devoted specifically to this topic     **Complexity Issues in Logic Programming** ,1995     **Subject Guide to Books in Print** ,1993     **Books in Print** ,1994
