Flows in Climate Dynamics Freddy Bouchet, Antoine Venaille, Tapio Schneider, Christophe Salomon, 2020 This book collects the text of the lectures given at the Les Houches Summer School on Fundamental aspects of turbulent flows in climate dynamics held in August 2017 Leading scientists in the fields of climate dynamics atmosphere and ocean dynamics geophysical fluid dynamics physics and non linear sciences present their views on this fast growing and interdisciplinary field of research by venturing upon fundamental problems of atmospheric convection clouds large scale circulation and predictability Climate is controlled by turbulent flows Turbulent motions are responsible for the bulk of the transport of energy momentum and water vapor in the atmosphere which determine the distribution of temperature winds and precipitation on Earth Clouds weather systems and boundary layers in the oceans and atmosphere are manifestations of turbulence in the climate system Because turbulence remains as the great unsolved problem of classical physics we do not have a complete physical theory of climate The aim of this summer school was to survey what is known about how turbulent flows control climate what role they may play in climate change and to outline where progress in this important area can be expected given today's computational and observational capabilities This book reviews the state of the art developments in this field and provides an essential background to future studies All chapters are written from a pedagogical perspective making the book accessible to masters and PhD students and all researchers wishing to enter this field It is complemented by online video of several lectures and seminars recorded during the summer school

The El Niño-Southern Oscillation Phenomenon Edward S. Sarachik, Mark A. Cane, 2010-02-18 Many climatic extremes around the globe such as severe droughts and floods can be attributed to the periodic warming of the equatorial Pacific sea surface termed the El Niño or Southern Oscillation ENSO Advances in our understanding of ENSO in which Edward S Sarachik and Mark A Cane have been key participants have led to marked improvements in our ability to predict its development months or seasons allowing adaptation to global impacts This book introduces basic concepts and builds to more detailed theoretical treatments Chapters on the structure and dynamics of the tropical ocean and atmosphere place ENSO in a broader observational and theoretical context Chapters on ENSO prediction past and future and impacts introduce broader implications of the phenomenon This book provides an introduction to all aspects of this most important mode of global climate variability for research workers and students of all levels in climate science oceanography and related fields

Improving weather and climate prediction with better representation of fast processes in atmospheric models Many atmospheric processes that influence Earth's weather and climate occur at spatiotemporal scales that are too small to be resolved in large scale models They must be parameterized which means approximately representing them by variables that can be resolved by model grids Fast Processes in Large Scale Atmospheric Models Progress Challenges and Opportunities explores ways to better investigate and represent multiple parameterized processes in models and thus improve their ability to make accurate climate and weather predictions Volume highlights include Historical development of the parameterization of fast processes in numerical models Different types of major sub grid processes and their parameterizations Efforts to unify the treatment of individual processes and their interactions Top down versus bottom up approaches across multiple scales Measurement techniques observational studies and frameworks for model evaluation Emerging challenges new opportunities and future research directions The American Geophysical Union promotes discovery in Earth and space science for the benefit of humanity Its publications disseminate scientific knowledge and provide resources for researchers students and professionals

The Three Galileos: The Man, The Spacecraft, The Telescope Cesare Barbieri, Jürgen H. Rahe, Torrence V. Johnson, Anita M. Sohus, 2013-03-14 The idea of having a conference in Padova describing the results obtained by the Galileo spacecraft and the characteristics of the Telescopio Nazionale Galileo began in 1995 when a number of colleagues from both sides of the Atlantic began exchanging suggestions and ideas Looking at the schedules of the two teams it was clear that the beginning of January 1997 would be a good time to hold the conference these dates also luckily coincided with the dates of the memorable discovery of the Medicean moons of Jupiter by Galileo Galilei in Padova in 1610 To emphasize these three elements the name of the conference was then proposed and accepted by the involved parties NASA and JPL in the United States the German space agency DARA the University of Padova and the Astronomical Observatory in Padova I wish to recall a few key dates In January 1610 Galileo from his house in Padova had the first hint of three and then four stars connected to Jupiter In December 1995 the probe released from the spacecraft entered the atmosphere of Jupiter and the spacecraft entered orbit about Jupiter These extraordinary events were followed at JPL by a number of representatives of many institutions and space agencies In June 1996 the Telescopio Nazionale Galileo was inaugurated by the King of Spain Juan Carlos I in the presence of Prof Luigi Berlinguer Minister of University and Science These ceremonies occurred as the spacecraft started touring the moon Europa

Bonnet, L. Gray, J. Langen, M. Lockwood, 2007-10-11 2 With a global average irradiance of 342 W m^{-2} the Sun is by far the largest source of energy for planet Earth. In comparison the internal energy produced by Earth itself is only about 0.087 W m^{-2} (Pollack et al 1993) which in turn is 3.5 times larger than the 0.025 W m^{-2} of heat produced by the burning of fossil fuels. About 31% of the solar energy which arrives at the top of the atmosphere is reflected back to space by scattering from clouds, aerosols and the Earth's surface. Almost 20 units of solar radiation are absorbed in the atmosphere. The remaining 49 units are absorbed at the surface. Evaporation of water at the Earth's surface consumes 23 units and 7 units are transferred to the atmosphere by heat conduction. On balance 19 units are lost from the Earth's surface as infrared radiation, however consisting of 11.4 going upward and 9.5 returning from the atmosphere to the Earth's surface (see also Rosenfeld 2006). There is thus a sixfold recycling of energy. This is the greenhouse effect established by the presence of water vapor and other greenhouse gases: CO_2 , CH_4 , N_2O and CFCs in the atmosphere. Due to human activities the latter have been increasing in the atmosphere, causing climate warming through an energy imbalance of 2.53 W m^{-2} more than 100 times larger than the heat released into the atmosphere by the burning of fossil fuels.

Studies Of Cloud, Convection And Precipitation Processes Using Satellite Observations William B Rossow, George Tselioudis, Zhengzhao Johnny Luo, 2022-10-26 Clouds, convection and precipitation processes are central components of Earth's weather and climate. They are produced by atmospheric motions across a very wide range of space-time scales from local weather to long-term global climate variation. They feedback on these motions by perturbing the heating-cooling that drive the atmospheric circulation. These processes also perturb the oceanic circulation and land surface properties that affect the atmospheric circulation. Because of the coupling of the atmosphere-ocean-land system across all scales by cloud, convection and precipitation processes, studying their behaviors requires measurements in space-time variations across all these scales simultaneously. Satellite constellations with global coverage and high time resolution offer the ideal platforms for such observations. This book summarizes some of the latest research using combinations of various satellite observations to study these processes and to evaluate their representations in global weather and climate models. Included with this publication are downloadable electronic slides and accompanying notes of each lecture for students, teachers and public speakers around the world to be better able to understand cloud, convection and precipitation processes.
