Deep Vibration Compaction As Plasto:

Rutteldruckverdichtung Als Plastodynamisches Problem / Deep Vibration Compaction as Plastodynamic Problem W Fellin, 2018-05-08 Vibroflotation is a method of ground improvement up to depths of 40 metres It has been successfully used since 1936 but the major problem with this method is that in spite of the fact that it performs well nobody can explain how it works The techniques for checking the quality of the compaction during vibration are unreliable making the method as a whole unquantifiable and unmeasurable This title explores the problems surrounding the method looking at deep compaction plastodynamics and the Riemann problem amongst other issues showing the reader what information from the movement of the vibration can be used as an additional quality control and to assess effectiveness **Compaction of Soils, Granulates and Powders** W. Fellin, D. Kolymbas, 2000-01-01 This interdisciplinary volume comprises papers from several fields related to compaction Topics include soil compaction for pavements and roads deep soil compaction by vibration impact and underground explosion compaction control and compaction processes in engineering Development of Soft Particle Code (SPARC) Chien-Hsun Chen, 2015-08-31 This work aims at developing a numerical simulation method Soft Particle Code SPARC The term textit soft emphasizes that no boundaries between particles are defined and every particle possesses a support consisting of a set of adjacent particles The polynomial interpolation approximation method is utilized for the evaluation of spatial derivatives using the information carried by particles in supports The system of equations consisting of spatial derivatives is solved using an iterative nonlinear solver and the computation of the Jacobian matrix is parallelized The simulations of laboratory tests have been carried out to show the applications and limitations of the current version of SPARC In addition to the simulations laboratory zig zag model tests using fine sand were carried out in which the cyclic tilt of a retaining wall induces a peculiar motion in the backfill sand with closed trajectories eddies On Linear-Elastic, Cross-Anisotropic Rock Anastasia Blioumi, 2014 English summary Rocks composed of parallel layers are cross anisotropic materials This thesis describes a new approximate solution for the determination of the properties of these materials based on mold cavity expansion experiments German description Gesteine die aus parallelen Schichten bestehen sind quer anisotrope Materialien Die Disseration beschreibt eine neue Naherungslosung zur Bestimmung der Eigenschaften solcher Materialien basierend auf Hohlraumaufweitungs Versuchen Daten aus Radialpressversuchen dienen der inversen Analyse des Problems Wenn der innere Druck der Radius des Hohlraums die Orientierung der Schieferung und die Verschiebungen bekannt sind ergibt die Naherungslosung Materialparameter Kombinationen die die gemessenen Verschiebungen gut abbilden Die Losung ist jedoch nicht eindeutig Dreidimensionale Finite Elemente Modellierung wird in dieser Arbeit verwendet um Hohlraumaufweitung in linear elastischem quer anisotropem Gestein zu simulieren Eine numerische Untersuchung wird durchgefuehrt um das Modell richtig zu etablieren Randbediengungen Grosse des Diskretisierungsbereichs usw und die moglichen Einflussgrossen z B Genauigkeit der Bestimmung der

Schieferungsorientierung zu beurteilen. Die Ergebnisse der Feldmessungen werden dann mit den numerisch berechneten radialen Verschiebungen der Hohlraumwand verglichen. Letztere entstehen durch die Implementierung von Materialparametern, die aus der genannten Näherungslosung zurückgerechnet werden. Ähnlichkeiten und Unterschiede werden beschrieben und erklärt. Eine alternative Methode zur Ermittlung des Verhaltens von quer anisotropen Materialien mittels kleinmasstablicher Hohlraumaufweitungs Laborversuche in einem künstlichen queranisotropen Material ist ebenfalls erwogen worden. Der Aufbau und die Prinzipien eines solchen Versuchs werden beschrieben und dessen Ausführbarkeit wird untersucht.

Barodesy and its Application for Clay Gertraud Medicus, 2015-08-28 Barodesy is a constitutive model for granular materials. It is based on proportional strain and stress paths and the asymptotic behaviour of soil. In this work an existing relation for proportional strain paths and proportional stress paths is further developed. A modification of barodesy to model clay behaviour is introduced. Common concepts of soil mechanics such as critical states, barotropy and pyknotropy are comprised.

Applications and developments of Barodesy Fabian Schranz, 2019-04-01 Barodesy is a constitutive model for granular materials such as sand and clay. It is based on the asymptotic behaviour of granular media at a constant deformation rate. In this work the existing sand version of Barodesy is improved. For this purpose the underlying scalar equations are simplified using different concepts from soil mechanics. The improved version is also compared with laboratory tests and different elastoplastic and hypoplastic constitutive relations. Also the stability of slopes and advanced stress paths such as the rotation of the principle stresses are investigated with these models.

On the Face Stability of Shallow Tunnels in Sand Ansgar Kirsch, 2009 Various models have been proposed for the prediction of the necessary support pressure at the face of a shallow tunnel. To assess their quality the collapse of a tunnel face was modelled with small scale model tests at single gravity. The evolution of the failure mechanism and the development of the support force at the face in dry sand were investigated. The observed displacement patterns show a negligible influence of overburden on the extent and evolution of the failure zone. The latter is significantly influenced though by the initial density of the sand. In dense sand a chimney wedge type collapse mechanism developed which propagated towards the soil surface. Initially loose sand did not show any development of a discrete collapse mechanism. The necessary support force was neither influenced by the overburden nor the initial density. A comparison with quantitative predictions by several theoretical models showed that the measured necessary support pressure is overestimated by most of the models. Only those by Vermeer, Ruse and Leca, Dormieux were able to predict the necessary support pressure on a 95 % confidence level. A three dimensional finite element investigation of face stability served to assess the ability of two constitutive models: an elastoplastic Mohr-Coulomb and a hypoplastic model to predict the necessary support pressure and the displacements at the tunnel face. The simulation of the small scale experiments revealed that the observed necessary support pressure and incremental displacements were predicted sufficiently well with both constitutive models.
