

Managing Data Storage in the Network

The Internet backplane protocol, or IBP, supports logistical networking to allow applications to control the movement and storage of data between nodes.

To ensure a robust and scalable network, early designers of the Internet chose a stateless model: Routers transfer data statelessly, and routing algorithms, which require only that the routers behave correctly, determine the path of data from sender to receiver. Although the data is stored transiently in the routers' buffers, this storage is by design never utilized by the routing algorithms. This statelessness has allowed the Internet to scale far beyond its original design while maintaining stable levels of performance and reliability.

Major uses of the Internet, however, have shifted from communication to the access and management of distributed data. Caching and replicating content on the World Wide Web, for example, is a rapidly growing global industry, and massive scientific data sets are being distributed via networked systems of large storage resources. Managing shared state in such systems is in no way a part of the

underlying network model, and consequently must be implemented using application-specific mechanisms that are rarely interoperable. The result is a balkanization of state management capabilities that prevents many applications from benefiting from the kind of standardization, interoperability, and scalability that have made the Internet into such a powerful communication tool.

The Internet backplane protocol provides a uniform interface to state management that is integrated with Internet networking protocols. IBP supports logistical networking in large-scale, distributed applications. (See the sidebar, "IBP and Logistical Networking" for a discussion of work in this area.) The protocol's name reflects its purpose: to enable applications to treat the Internet as if it were a processor backplane. IBP provides access to remote storage and standard Internet resources and directs communication between them with the IBP API. In short, the motivation behind IBP is to design,
