Wong, 2025-07-16 This book discusses linkages between the natural and disturbed chemical composition of the earth's surface and ecological and human health. It reviews the environmental geochemical cycles of natural elements and persistent toxic substances in the environment, highlighting the degradation of soil and water resources due to human activities such as extraction and usage of minerals. There is an attempt to provide evidence concerning the health effects of consuming contaminated food due to frequent consumption of mercury-laden fish. Lastly, sources, fates, and ecological effects of various pollutants are presented, including microplastics and associated chemicals. Details linkages between the natural and disturbed chemical composition of the earth's surface and environmental and human health, focusing on food contamination. Discusses emerging pollutants with potential widespread hazardous effects such as bisphenol A and phthalates. Reviews safe food production and quality as well as the management, regulation, and policies concerning toxic chemicals. Contains cutting-edge knowledge on safe food production and remediating technologies. Describes how geochemical cycling results in food contamination.

Arsenic and Old Mustard: Chemical Problems in the Destruction of Old Arsenical and 'Mustard' Munitions J.F. Bunnett, Marian Mikolajczyk, 2013-11-11 More than ten million poison gas shells, mortar bombs, etc. lie hidden in Europe; many of them relics from World War I. Some were fired and failed to detonate; others were abandoned in old ammunition dumps. Most retain their load of chemical warfare (CW) agents. They are turned up daily in the course of farming and construction. Many European nations have permanent departments concerned with their collection and destruction. Old munitions when discovered are usually heavily corroded and difficult to identify. Is it a CW munition? Or an explosive? If CW, what agent does it contain? Once identified, one has to select a destruction method. Some of the methods that have been proposed are less than perfect and are often complicated by the presence of extraneous chemicals, either mixed with the CW agents during manufacture or formed over decades in the ground. Of particular interest are the insiders' reports on the German CW programmes of both World Wars and the current status of Russian chemical armaments.
