Physical Methods in Heterocyclic Chemistry A. R. Katritzky,2013-10-22

Physical Methods in Heterocyclic Chemistry Volume IV discusses the application of physical methods to organic chemistry and in particular to heterocyclic chemistry Since the publication in 1963 of the first two volumes of this treatise the application of physical methods to organic chemistry and in particular to heterocyclic chemistry has proceeded apace The importance of physical methods to structure determination and to the understanding of inter and intramolecular interactions has increased no less than the flood of new work Heterocyclic chemists are thus faced with the necessity of having more to comprehend for the efficient execution of their own work The present volume includes chapters on electric dipole moments and heteroaromatic reactivity which originally appeared in Volume I and chapters on nuclear quadrupole resonance nuclear magnetic resonance and infrared spectra which originally formed part of Volume II Also included is one new topic dielectric absorption

Metal Promoted Selectivity in Organic Synthesis A. Noels,M. Graziani,A.J Hubert,2012-12-06 The demand for selective organic reactions is growing more acute everyday Indeed greater product selectivity has an important impact on energy and resource utilization in terms of reduced process energy

requirements for product separation and purification in terms of low value by products and in terms of environmental acceptance and compatibility Moreover more and more chemicals especially pharmaceuticals have to be sold in an optically active form The search for selectivity constitutes a tremendous challenge for the chemists In the last two decades homogeneous transition metal based catalysis has emerged as one of the most promising tools for obtaining selectivity In connection with developments in this area this book contains updated and expanded versions of most of the lectures presented at a Cornett course held in Trieste Italy in 1989 and sponsored by the European Community A primary aim is to cultivate a deeper understanding of the parameters that govern the selectivities and stimulate a wider utilization of transition metal based catalysis in organic synthesis All aspects of selectivity chemo regio stereo and enantioselectivity are considered and illustrated by applications in various fields of organic synthesis The impact of catalysis in oxydation reduction carbonylation reactions carbene chemistry in Ni and Pd promoted dimerizations oligomerizations as well as fonctionalisations is stressed quite often with special emphasis laid on reaction mechanisms In this aspect the last chapter exemplifies the interest of high pressure NMR and IR when investigating the nature of reaction intermediates in homogeneous reactions
