Teeth Tell Tales Hayley L. Mickleburgh,2008-12 Similar to the osteological study of prehistoric human remains the study of human dental wear has been proven to afford a wealth of information on human cultural practices This study is aimed at recording and understanding the dental wear patterns in human dentitions from the Caribbean archaeological sites of Anse la Gourde located on the most eastern point of Guadeloupe and Tutu located on the small island of St Thomas U S Virgin Islands The premise of this research is the assumption that dental wear patterns are informative of a great many aspects of human health and lifestyle The use of the mouth and teeth in both masticatory and non masticatory activities is assumed to leave traces which can be studied post mortem to infer the lifestyle linked to such activities In order to build a complete picture of these activities and the lifestyle linked to the dental wear patterns other lines of evidence are also followed here such as ethnohistoric and ethnographical accounts and evidence from modern dentistry Using this combination of different lines of evidence it has been possible to characterize the diet and a range of cultural practices of the inhabitants at each site The individuals selected in this sample very actively engaged their teeth in many non masticatory culturally defined activities

which put their dentitions under a great deal of stress It seems these people s use of their mouths and teeth in this way was a very conscious decision characterized by their cultural background Animal Teeth and Human Tools Christy G. Turner II, Nicolai D. Ovodov, Olga V. Pavlova, 2013-07-11 The culmination of more than a decade of fieldwork and related study this unique book uses analyses of perimortem taphonomy in Ice Age Siberia to propose a new hypothesis for the peopling of the New World The authors present evidence based on examinations of more than 9000 pieces of human and carnivore bone from 30 late Pleistocene archaeological and palaeontological sites including cave and open locations which span more than 2000 miles from the Ob River in the West to the Sea of Japan in the East The observed bone damage signatures suggest that the conventional prehistory of Siberia needs revision and in particular that cave hyenas had a significant influence on the lives of Ice Age Siberians The findings are supported by more than 250 photographs which illustrate the bone damage described and provide a valuable insight into the context and landscape of the fieldwork for those unfamiliar with Siberia
