Barnett, Christopher R. Barnett, 2008-02-01 Aging is an almost universal process within biological systems one which leads to a decline in functional capacity disease onset and eventually death There has been much interest in recent years to elucidate the molecular mechanisms that underlie the aging process Many theories have been proposed since the last century that aim to explain the causes of aging There is no one theory that completely satisfies the phenotype of aging but genetics and environmental factors play an important role in the etiology of age related pathologies and the aging process However there is still much to be learned about the aging process which has been termed one of the last great frontiers in biology Demographic changes worldwide are leading to increased average life expectancies within our

populations These changes in population characteristics will impact upon the economies of the supporting society with increasing healthcare and infrastructural costs arising from the prevalence of age related pathologies and other physical disabilities associated with advancing years Many researchers worldwide are working in the attempt to identify key cellular processes through which it might one day be possible to slow down the aging process and thus increase the health span of humans Numerous research projects from the cellular through to tissue organ and whole organism studies are currently underway to investigate the multifactorial aging process

Quality Handling and Evaluation Ramdane Dris, S. Mohan Jain, 2007-05-08 Food quality is becoming an ever increasing important feature for consumers and it is well known that some food crops are perishable and have a very short shelf and storage life An effective quality assurance system throughout the handling steps between harvest and retail display is essential to provide a consistently good quality supply of fresh food crops to the consumers and to protect the reputation of a given marketing label Food manufacturing companies all over the world are increasingly focussing on quality aspect of food including minimally processed food to meet consumer demands for fresh like and healthy food products To investigate and control quality one must be able to measure quality related attributes Quality of produce encompasses sensory attributes nutritive values chemical constituents mechanical properties functional properties and defects Successful postharvest handling of crops requires careful coordination and integration of the various steps from harvest operations to consumer level in order to maintain the initial product quality Maturity at harvest is one feature of quality of perishable products it has great influence on their postharvest behavior during marketing Safety assurance can be part of quality assurance and its focus on minimizing chemical and microbial contamination during production harvesting and postharvest handling of intact and fresh cut of commodities Essentially electromagnetic often optical properties relate to appearance mechanical properties to texture and chemical properties to flavor taste and aroma

Extracellular Sugar-Based Biopolymers Matrices Ephraim Cohen, Hans Merzendorfer, 2019-07-02 The extracellular matrix ECM is an acellular three dimensional

network composed of proteins glycoproteins proteoglycans and exopolysaccharides It primarily serves as a structural component in the tissues and organs of plants and animals or forms biofilms in which bacterial cells are embedded ECMs are highly dynamic structures that undergo continuous remodeling and disruptions are frequently the result of pathological processes associated with severe diseases such as arteriosclerosis neurodegenerative illness or cancer In turn bacterial biofilms are a source of concern for human health as they are associated with resistance to antibiotics Although exopolysaccharides are crucial for ECM formation and function they have received considerably little attention to date The respective chapters of this book comprehensively address such issues and provide reviews on the structural biochemical molecular and biophysical properties of exopolysaccharides These components are abundantly produced by virtually all taxa including bacteria algae plants fungi invertebrates and vertebrates They include long unbranched homopolymers cellulose chitin chitosan linear copolymers alginate agarose peptoglycans such as murein heteropolymers like a variety of glycosaminoglycans hyaluronan dermatan keratin heparin Pel and branched heteropolymers such as pectin and hemicellulose A separate chapter is dedicated to modern industrial and biomedical applications of exopolysaccharides and polysaccharide based biocomposites Their unique chemical physical and mechanical properties have attracted considerable interest inspired basic and applied research and have already been harnessed to form structural biocomposite hybrids for tailor made applications in regenerative medicine bioengineering and biosensor design Given its scope this book provides a substantial source of basic and applied information for a wide range of scientists as well as valuable textbook for graduate and advanced undergraduate students
