Anomalous States:

Anomalous States David Lloyd, 1993 *Anomalous States* is an archeology of modern Irish writing David Lloyd commences with recent questioning of Irish identity in the wake of the northern conflict and returns to the complex terrain of nineteenth century culture in which those questions of identity were first formed In five linked essays he explores modern Irish literature and its political contexts through the work of four Irish writers Heaney Beckett Yeats and Joyce Beginning with Heaney and Beckett Lloyd shows how in these authors the question of identity connects with the dominance of conservative cultural nationalism and argues for the need to understand Irish culture in relation to the wider experience of colonized societies A central essay reads Yeats's later works as a profound questioning of the founding of the state Final essays examine the gradual formation of the state and nation as one element in a cultural process that involves conflict between popular cultural forms and emerging political economies of nationalism and the colonial state Modern Ireland is thus seen as the product of a continuing process in which Lloyd argues the passage to national independence that defines Ireland's post colonial status is no more than a moment in its continuing history *Anomalous States* makes an important contribution to the growing body of work that connects cultural theory with post colonial historiography literary analysis and issues in contemporary politics It will interest a wide readership in literary studies cultural studies anthropology and history

Generalized Sturmians And Atomic Spectra John Scales Avery, James Emil Avery, 2006-11-14 This book describes the generalized Sturmian method which offers a fresh approach to the calculation of atomic spectra Generalized Sturmians are isoenergetic solutions to an approximate many electron Schrödinger equation with a weighted potential The weighting factors are chosen in such a way as to make all of the solutions correspond to a given energy The advantage of such an isoenergetic basis set is that every basis function has the correct turning point behavior needed for efficient synthesis of the wave function The book also discusses methods for automatic generation of symmetry adapted basis sets Calculations using the generalized Sturmian method are presented and compared with experimental results from the NIST database The relationship of Sturmians to harmonic polynomials and hyperspherical harmonics is also described Methods for treating angular functions and angular integrals by means of harmonic projection are discussed and these methods are shown to be especially useful for relativistic calculations A final chapter discusses application of the generalized Sturmian method to the calculation of molecular spectra

Recent Trends in Theory of Physical Phenomena in High Magnetic Fields Israel D. Vagner, Peter Wyder, Tsofar Maniv, 2012-12-06 A comprehensive collection of papers on theoretical aspects of electronic processes in simple and synthetic metals superconductors bulk and low dimensional semiconductors under extreme conditions such as high magnetic and electric fields low and ultra low temperatures The main emphasis is on low dimensional conductors and superconductors where correlated electrons interacting with magnetic or nonmagnetic impurities phonons photons or nuclear spins result in a variety of new physical phenomena such as quantum oscillations in the superconducting state Condon instability Skyrmions and composite fermions in quantum Hall effect systems and hyperfine field induced mesoscopic and nanoscopic phenomena Several new experimental achievements are reported that promise to delineate future trends in low temperature and high magnetic field physics including the experimental observation of the interplay between superconductivity and nuclear spin ordering at ultra low temperatures new observations of Condon domains in normal metals and an experimental proposal for the realisation of isotopically engineered semiconductor based spin qubit elements for future quantum computation and communication technology

Yoga & Parapsychology K. Ramakrishna Rao, 2010-01-01 Yoga and Parapsychology are two areas in which a significant amount of professional research is awaited Parapsychology considered as the discipline to study psi psychic abilities is essentially the science of siddhis extraordinary human abilities Yoga is considered to be an effective psycho spiritual pursuit that results in the manifestation of a variety of supernormal phenomena In fact Patanjali s Yoga Sutras is the foundational text of psychic science One of its four parts Vibhuti Pada is filled with the description and discussion of a variety of paranormal phenomena There is thus an intrinsic commonality between yoga and parapsychology which remains essentially unexplored in any systematic way A serious and scientific study of the two and the resultant synergy of their confluence could result in resolving many of the riddles that puzzle parapsychology today and be a harbinger of a vibrant

Negative Differential Resistance and Instabilities in 2-D Semiconductors N. Balkan, B.K. Ridley, A.J. Vickers, 2012-12-06 Instabilities associated with hot electrons in semiconductors have been investigated from the beginning of transistor physics in the 1940s The study of NDR and impact ionization in bulk material led to devices like the Gunn diode and the avalanche photo diode In layered semiconductors domain formation in HEMTs can lead to excess gate leakage and to excess noise The studies of hot electron transport parallel to the layers in heterostructures single and multiple have shown abundant evidence of electrical instability and there has been no shortage of suggestions concerning novel NDR mechanisms such as real space transfer scattering induced NDR inter sub band transfer percolation effects etc Real space transfer has been exploited in negative resistance PETs NERFETs and in the charge injection transistor CHINT and in light emitting logic devices but far too little is known and understood about other NDR mechanisms with which quantum well material appears to be particularly well endowed for these to be similarly exploited The aim of this book is therefore to collate what is known and what is not known about NDR instabilities and to identify promising approaches and techniques which will increase our understanding of the origin of these instabilities which have been observed during the last decade of investigations into high field longitudinal transport in layered semiconductors The book covers the fundamental properties of hot carrier transport and the associated instabilities and light emission in 2 dimensional semiconductors dealing with both theory and experiment

Protecting Individual Privacy in the Struggle Against Terrorists National Research Council, Division on Engineering and Physical Sciences, Computer Science and Telecommunications Board, Division on Behavioral and Social Sciences and Education, Committee on National Statistics, Committee on Law and Justice, Committee on Technical and Privacy Dimensions of Information for Terrorism Prevention and Other National Goals, 2008-10-26 All U S agencies with counterterrorism programs that collect or mine personal data such as phone records or Web sites visited should be required to evaluate the programs effectiveness lawfulness and impacts on privacy A framework is offered that agencies can use to evaluate such information based programs both classified and unclassified The book urges Congress to re examine existing privacy law to assess how privacy can be protected in current and future programs and recommends that any individuals harmed by violations of privacy be given a meaningful form of redress Two specific technologies are examined data mining and behavioral surveillance Regarding data mining the book concludes that although these methods have been useful in the private sector for spotting consumer fraud they are less helpful for counterterrorism because so little

is known about what patterns indicate terrorist activity Regarding behavioral surveillance in a counterterrorist context the book concludes that although research and development on certain aspects of this topic are warranted there is no scientific consensus on whether these techniques are ready for operational use at all in counterterrorism An Other Tongue Alfred Arteaga, 1994 As our millennium draws to a close we find ourselves in the midst of great and rapid global changes with nations and political systems dissolving all around us and the world becoming one of shifting identities of peoples unified and divided by such distinctions as nationality ethnicity race religion and colonial status The articulation and construction of these distinctions the very language of difference is the subject of An Other Tongue This collection of essays by a group of distinguished scholars including Norma Alarcón Gayatri Spivak Tzvetan Todorov and Gerald Vizenor explores the interconnections between language and identity The Chicanos the U S Mexico borderland polyglots whose sense of history nationality and race is as mixed as their language are the book's prime example But the authors recognize that border zones like diasporas and post colonial relations occur globally and their discussion of hybrid or mestizo identities ranges from the United States to the Caribbean to South Asia to Ireland Drawing on personal experience readings of poetry and fiction and cultural theory the authors detail the politics of being human through the mediation of language What does shadow mean to the Native American Indian or diaspora to the East Indian immigrant How does British colonialism yet affect Irish and Indian nationalist literary production Why is the split between Eastern and Western European language use necessarily schizophrenic So much of our sense of difference today is constructed as we speak and An Other Tongue speaks with eloquence to this phenomenon and will be of great interest to those concerned with the discourse of post colonial studies critical theory and the remapping of world literature Contributors Norma Alarcón Alfred Arteaga Juan Bruce Novoa Cordelia Chvez Candelaria Michael G Cooke Edmundo Desnoes Eugene C Eoyang David Lloyd Lydie Moudileno Jean Luc Nancy Tejaswini Niranjana Ada Savin Gayatri Chakravorty Spivak Michael Smith Tzvetan Todorov Luis A Torres Gerald Vizenor

Static Forms Shir Alon, 2005-10-28 What does it mean to write a literature of the present In the early twentieth century Arabic and Hebrew writers faced a parallel predicament Modern literature aspired to reflect the contemporary moment yet the Middle Eastern present seemed incompatible with dominant literary forms especially the novel Projects of cultural awakening implied that Arabs and Jews were somehow inhabiting the present wrongly Arabic and Hebrew writers found themselves grappling with the simultaneous necessity and impossibility of narrating the present and achieved strikingly similar literary solutions to this challenge This book develops a new theory of the emergence of modernist literary forms through a series of parallel readings of Arabic and Hebrew prose Situating literary production in projects of modernization settler colonialism and state building Shir Alon traces the proliferation of what she calls static forms These literary forms articulate a modern present experienced as stuck suspended or absent embodying the lived temporalities of Orientalist fantasies of origin regimes of productive and reproductive labor and the routine violence of occupation Static Forms positions

writers such as Mahmud al Mas adi Sonallah Ibrahim Elias Khoury Adania Shibli S Y Agnon Y H Brenner and Yeshayahu Koren as innovators and theorists of global modernism writing the present as a series of suspensions of modernity s narrative of progress

Amorphous Solids William A. Phillips,2012-12-06 It is now ten years since it was first convincingly shown that below 1 K the thermal conductivity and the heat capacity of amorphous solids behave in a way which is strikingly different to that of crystalline solids Since that time there has been a wide variety of experimental and theoretical studies which have not only defined and clarified the low temperature problem more closely but have also linked these differences between amorphous and crystalline solids to those suggested by older acoustic and thermal experiments extending up to 100 K The interest in this somewhat restricted branch of physics lies to a considerable extent in the fact that the differences were so unexpected It might be thought that as the temperature probing frequency or more generally the energy decreases a continuum description in which structural differences between glass and crystal are concealed should become more accurate In a sense this is true but it appears that there exists in an amorphous solid a large density of additional excitations which have no counterpart in normal crystals This book presents a survey of the wide range of experimental investigations of these low energy excitations together with a review of the various theoretical models put forward to explain their existence and nature
