Laparoscopic-assisted anorectal pull-through vs. posterior sagittal anorectoplasty for treating high anorectal malformations: a single-center experience

Mohammad Anas AlShawwa¹, Ahmed AlWusaibie and Saud Al Shanafeey*

Abstract

Background/purpose: Surgical management of high-type anorectal malformations (ARM) has evolved over the years with the widespread of the laparoscopic approach over the last two decades. This study aims to compare the outcome of patients with high anorectal malformation (ARM) managed with laparoscopic-assisted anorectal pull-through (LAARP) vs. the open posterior sagittal anorectoplasty (PSARP) at a single institution.

Methods: A retrospective chart review of pediatric patients, who were managed for high-type ARM at our institution, was performed for the period 2000–2015. Nine were excluded because of a lack of important data. Demographic data, surgical approach, associated anomalies, and complications were collected. Functional outcome was measured using the modified clinical scoring for the defecation function of the Japanese study group of anorectal anomalies. Comparison between groups was done using the *T* test for continuous variables and the Fisher-exact test for proportions. $P < 0.05$ is considered statistically significant.

Results: There were 82 patients with high type imperforate anus (59 males and 23 females) 73% had laparoscopy vs. 27% open. Type of fistulae were rectourethral (36), rectovesical (12), no fistula (19), and (15) cloaca anomalies. Patients underwent surgery at a mean age 8.4 (laparoscopy) vs. 10.1 (open) months (P value = 0.14). There was no difference between the two groups regarding weight at the surgery or associated anomalies, except for VACTERAL and genitourinary malformations which were more among the laparoscopic group (8 vs. 1).

There was no statistical significance for all elements of defecation function score: sensation, constipation, and soiling (P values 0.17, 0.6, 0.07, respectively). There was no difference between the two groups regarding rectal prolapse ($P = 0.06$), whereas rectal stenosis is more in PSARP compared to LAARP ($P = 0.03$). The hospital stay was significantly shorter in LAARP 7.1 vs. 9.4 ($P = 0.006$).

Conclusions: The defecation function and complication rate for both laparoscopic and open groups were almost similar. This may justify the preference of the laparoscopic approach over the open one, given its minimally invasive nature.

Anorectal Malformations A Surgeons Experience:

Anorectal Malformations in Children Alexander Matthias Holschneider, John M. Hutson, 2007-08-16 *Anorectal Malformations in Children* represents an international consensus in understanding and treating anorectal malformations. Interesting new topics include tethered cord, vaginal reconstruction, continent catheterizable channels, and the impact on family studies by parents' organizations. The book not only carries on from the three previous editions by Douglas Stephens and Durham Smith (1963, 1971, and 1988) but assembles many new aspects in the broad field of anorectal and genitourinary malformations. Special attention is given to the new surgical techniques: posterior sagittal anorectal plasty (PSARP), urogenital sinus advancement, and laparoscopy. The results of an international workshop of 26 international authorities on congenital malformations of the organs of the pelvis and perineum are presented. The new classification proposed at the Krickenberg Conference will enable future studies comparing the types and the results of treatment of anorectal malformations. The book is an invaluable reference for all medical authorities with a special interest in anorectal and genitourinary malformations.

Anorectal Malformations Subir K. Chatterjee, 1993-05 Written for paediatric surgeons and other clinicians who deal with anorectal malformations, this text describes in detail the operative procedures for each important anomaly with the help of over 300 photographs, X-rays, and diagrams.

Neonatal Surgery Mario Lima, Olivier Reinberg, 2019-04-13 This comprehensive up-to-date reference on surgery in the neonate presents and explains the latest developments in the diagnosis and treatment of neonatal malformations and surgical pathologies. The coverage includes conditions involving the head and neck and the chest, disorders of the liver and biliary tract, gastrointestinal disorders, genitourinary conditions, and malformations of the anterior abdominal wall, defects, tumors, and various other pathologies. For each condition, the pathogenesis and the most current and innovative surgical and also medical approaches are described with the aid of numerous illustrations. Minimally invasive strategies receive particular attention, and tips and tricks that will be of value in clinical practice are highlighted. The book includes a general part covering topics such as embryology, anatomy, prenatal diagnosis, and anesthesia, and also provides detailed advice on pre and postoperative care with special consideration of nutritional problems. *Neonatal Surgery* will serve as an excellent guide for all pediatric and neonatal surgeons, whether in training or experienced.
