First Generation Mainframes Stephen H. Kaisler,2018-11-30 This volume describes several different models of IBM computer systems characterized by different data representations and instruction sets that strongly influenced computer system architecture in the 1950s and early 1960s They focused on a common system architecture that allowed peripherals to be used on different systems albeit with specific adapters These systems were modular which made them easy to manufacture configure and service Computing with UNIVAC they used reliable Williams Tubes for memory and later introduced magnetic core memory IBM developed its own magnetic tape drives and magnetic drums that were both faster and more reliable than UNIVAC s peripherals The first software systems that could reasonably be called operating systems enabled more efficient use of programmer time and system resources The development of programming languages notably FORTRAN and assembly language processors notably Autocoder improved the productivity of programmers In addition IBM developed one of the finest product marketing sales and servicing organizations in the world The legacy of the IBM 700 series is found in their popular successors the IBM 7000 Series which will be described in a forthcoming volume

Matrix Algebra James E. Gentle,2007-08-06 Matrix algebra is one of the most important areas of mathematics for data analysis and for statistical theory The first part of this book presents the relevant aspects of the theory of matrix algebra for applications in statistics This part begins with the fundamental concepts of vectors and vector spaces next covers the basic algebraic properties of matrices then describes the analytic properties of vectors and matrices in the multivariate calculus and finally discusses operations on matrices in solutions of linear systems and in eigenanalysis This part is essentially self contained The second part of the book begins with a consideration of various types of matrices encountered in statistics such as projection matrices and positive definite matrices and describes the special properties of those matrices The second part also describes some of the many applications of matrix theory in statistics including linear models multivariate analysis and stochastic processes The brief coverage in this part illustrates the matrix theory developed in the first part of the book The first two parts of the book can be used as the text for a course in matrix algebra for statistics students or as a supplementary text for various courses in linear models or multivariate statistics The third part of this book covers numerical linear algebra It begins with a discussion of the basics of numerical computations and then describes accurate and efficient algorithms for factoring matrices solving linear systems of equations and extracting eigenvalues and eigenvectors Although the book is not tied to any particular software system it describes and gives examples of the use of

modern computer software for numerical linear algebra This part is essentially self contained although it assumes some ability to program in Fortran or C and or the ability to use R S Plus or Matlab This part of the book can be used as the text for a course in statistical computing or as a supplementary text for various courses that emphasize computations The book includes a large number of exercises with some solutions provided in an appendix Sources for Software for Computer Mapping and Related Disciplines ,1988
