Anticancer Drugs Carmen Avendaño, J. Carlos Menéndez, 2008-06-04 Antitumor chemotherapy is nowadays a very active field of research and a huge amount of information on the topic is generated every year Although many books are available that deal with clinical aspects of cancer chemotherapy this book addresses the need for an updated treatment from the point of view of medicinal chemistry and drug design The focus of Medicinal Chemistry of Anticancer Drugs is on the mechanism of action of antitumor drugs from the molecular point of view and on the relationship between chemical structure and chemical and biochemical reactivity of antitumor agents aiming at the rationalization of the action of this type of drug which would allow the design of new active structures Explains the biological basis of cancer treatment and the role of chemists in improving anticancer drugs Provides the historical background and serves as a comprehensive and practical guide on cancer research and anticancer drug development Includes coverage of different approaches to treating cancer drug resistance and a chapter on cancer prevention

Organ Directed Toxicities of Anticancer Drugs Miles P. Hacker, John S. Lazo, Thomas R. Tritton, 2012-12-06 The addition of chemotherapy as an effective means to treat cancer has had a major impact on selected human malignancies Due to a general inability to differentiate between normal and neoplastic cells little selectivity exists in currently used oncolytic drugs Consequently significant toxicity to the patient is expected when systemic cancer chemotherapy is chosen as an appropriate therapeutic intervention Much of this toxicity such as damage to the bone marrow gastrointestinal tract or hair follicles is predictable based upon the fact that anticancer drugs kill actively dividing cells These types of toxicities while serious are usually manageable and reversible and are therefore not often considered to be dose limiting Unfortunately several of the most important anticancer drugs also damage tissues in which the growth fraction is relatively small Such toxicities can not be predicted based on the chemical structure of the drugs are often not detected in preclinical studies and are encountered frequently for the first time in clinical studies Further unlike most of the proliferative dependent toxicities the unpredicted toxicities are usually irreversible or only partially reversible upon cessation of drug administration Because of this the unpredicted toxicities are referred to as dose limiting They represent a significant barrier to the ultimate efficacy of several of our most important anticancer drugs

Plant-Derived Anticancer Drugs in the OMICS Era Deepu Pandita, Anu Pandita, 2023-10-27 The current anti cancer synthetic medicines are deemed inefficient and unsafe state the editors of this new book Plant based lead molecules however such as taxol camptothecin podophyllotoxins vinblastine vincristine homoharringtonine and numerous other anticancer compounds from nature s arsenal are potentially safe and can be powerful alternatives that effectively fight against cancer The volume looks at a variety of medicinal plants and approaches that have shown beneficial results against cancer Topics in the book include Unani approaches of anticancer plants genetic engineering and CRISPR CAS mediated editing to enhance a plant s anticancer potential computational approaches used in anticancer plants and more The volume also examines the metabolomics of plants that give them anti cancer properties

The Search for New Anticancer Drugs Michael Waring, B.A. Ponder, 1992-11-30 Most of the anti cancer drugs in use today were discovered by happy accident rather than design yet the rational design of better anti cancer drugs remains a cherished goal and one of the most important challenges facing medical science This book represents a compilation of views and progress reports which illustrate the diversity of approaches to the problem Recent research has confirmed the belief that critical genetic changes are at work in cancer cells The genome then DNA in biochemical terms surely represents a critical target for specific chemotherapy of cancer and several chapters address the issue of attacking DNA gene targetting and the like Others deal with principles of rational design exploitation of novel modalities and targets or the nuts and bolts of antitumour drug testing While no attempt has been made to provide a comprehensive coverage of this wide ranging and vitally important subject the present volume in the series will provide much food for thought

Chemistry and Pharmacology of Anticancer Drugs David E. Thurston, Ilona Pysz, 2021-03-17 While drug therapies developed in the last 80 years have markedly improved treatment outcomes and the management of some types of cancers the lack of

effectiveness and side effects associated with the most common treatment types remain unacceptable. However, recent technological advances are leading to improved therapies based on targeting distinct biological pathways in cancer cells.

Chemistry and Pharmacology of Anticancer Drugs is a comprehensive survey of all families of anticancer agents and therapeutic approaches currently in use or in advanced stages of clinical trials, including biological-based therapies. The book is unique in providing molecular structures for all anticancer agents, discussing them in terms of history of development, chemistry, mechanism of action, structure-function relationships, and pharmacology. Novel Anticancer Drug Protocols John K. Buolamwini, Alex A. Adjei, 2008-02-01

We are in an exciting era in the war against cancer with real prospects for novel anticancer drugs that are cancer cell specific without the toxicities that have been the hallmark of conventional cytotoxic cancer chemotherapy. Advances in cancer cell biology, fueled by the molecular biology revolution, have resulted in the uncovering of many novel potential molecular targets for cancer therapy. New anticancer drug discovery and development is now largely focused on exploiting these new molecular targets, which encompass oncogenes, tumor suppressor genes, and their gene products, as well as targets involved in tumor angiogenesis, metastasis, survival, and longevity mechanisms. Exploitation of some of these targets has already yielded fruits and introduced new paradigms of molecularly targeted cancer therapy into the clinic, namely protein kinase inhibition by antibodies or small molecules, exemplified by Herceptin (trastuzumab), a humanized antibody targeted against the HER2 growth factor receptor tyrosine kinase for the treatment of metastatic breast cancer, and Gleevec (imatinib), a small molecule bcr-abl kinase inhibitor for the treatment of chronic myelogenous leukemia.
