Vascular Manifestations of Systemic Autoimmune Diseases Ronald A. Asherson, Ricard Cervera, Douglas A. Triplett, Steven B. Abramson, 2001-01-25 Not too long ago it was thought that inflammation of blood vessels was the sole manifestation of systemic autoimmune diseases Today however we know that disorders of coagulation injuries to both neutrophils and endothelial cells and certain lipids and amino acids are all intricately involved in the development of vascular disease How are all **Focus on Atherosclerosis Research** Leon V. Clark, 2004 Atherosclerosis is a degenerative condition in which arteries build up deposits called plaques atheromas which consist of lipids mainly cholesterol connective tissue and smooth muscle cells originating from the arterial wall Plaques develop quietly over a period of years and are

unnoticeable until there is an interruption in the normal flow of blood. Plaques may partially or totally block the blood's flow through an artery. Two things that can happen where plaques occur are bleeding/hemorrhage into the plaque and formation of a blood clot/thrombus on the plaque's surface. Atherosclerosis affects large and medium-sized arteries. The type of artery and where the plaque develops varies with each person. Atherosclerosis research has witnessed startling progress in recent years, partially due to new drugs as well as to new breakthroughs in molecular medicine.
