

ASSOCIATIVE LEARNING

Associative learning defines a learning situation when two stimuli become linked. The elements of one stimulus then become associated with the second stimulus.

DEFINITION

Associative learning occurs when two stimuli are paired so that a second stimulus is associated with the same events and situations as the first stimulus. Here is a simple scholarly definition:

"[Associative learning] refers to situations in which the combination of stimuli leads to changes in behavior" (Houwer & Hughes, 2020, p. 67)

EXAMPLES

Celebrity Endorsements

Brands pay celebrities to be in their advertisements so fans associate the brand with the beloved celebrity. The love for celebrity rubs-off as love for the product.

- Stimulus: Beloved celebrity
- Associated stimulus: Car
- Result: Beloved car

Kohonen, 2012-12-06 Designers and users of computer systems have long been aware of the fact that inclusion of some kind of content addressable or associative functions in the storage and retrieval mechanisms would allow a more effective and straightforward organization of data than with the usual addressed memories with the result that the computing power would be significantly increased However although the basic principles of content addressing have been known for over twenty years the hardware content addressable memories CAMs have found their way only to special roles such as small buffer memories and control units This situation now seems to be changing Because of the development of new technologies such as very large scale integration of semiconductor circuits charge coupled devices magnetic bubble memories and certain devices based on quantum mechanical effects an increasing amount of active searching functions can be transferred to memory units The prices of the more complex memory components which earlier were too high to allow the application of these principles to mass memories will be reduced to a fraction of the total system costs and this will certainly have a significant impact on the new computer architectures In order

to advance the new memory principles and technologies more information ought to be made accessible to a common user

Handbook of Learning and Cognitive Processes W. Estes, 2022-07-30 Is it possible at present to identify a core cluster of theoretical ideas concepts and methods with which everyone working in the area of learning and cognition needs to be familiar Would it be possible to make explicit the relationships that we feel do or must exist among the various subspecialties ranging from conditioning through perceptual learning and memory to psycholinguistics and to present these in a sufficiently organized way to help specialists and non specialists alike in relating particular lines of research to the broader spectrum of activity These questions were posed to a substantial number of investigators who were most active in developing the ideas and doing the research in the early 1970s Originally published between 1975 and 1978 their response constitutes this 6 volume Handbook of Learning and Cognitive Processes The volumes survey the research and theory on learning and cognitive processes that were rapidly developing at the time The primary orientation was to concentrate on research and models aimed toward the development of general cognitive theory They were up to date with regard to theoretical and technical developments and sufficiently self contained to be readable by anyone with a reasonable scientific background regardless of their acquaintance with the technical jargon of particular specialties Previously out of print the Handbook is now available again as a set or as individual volumes **Information Technology** United States. Estes, 2014-06-20 Originally

published in 1978 Volume 6 concludes the survey of research and theory on learning and cognitive processes that was envisaged when the plan for this Handbook was sketched The primary orientation in the planning the Handbook was to concentrate on research and models aimed toward the development of general cognitive theory The first five chapters of this volume are organized in relation to one of the research areas that had expanded most vigorously during the period of planning and writing of the Handbook These chapters treat aspects of psycholinguistics most closely related to research and theory covered in the other volumes Perhaps the most fertile source of new concepts and models closely related to other branches of cognitive theory has been research on semantic memory This work is given a critical review and interpretation by Smith in the first chapter of this volume following which some lines of theoretical developmental leading upward into problems of comprehension of meaningful material are reviewed by Kintsch then connections downward into more elementary problems of coding in memory by Johnson Also Johnson s chapter shades into the very active current body of work on perceptual and memorial processes in reading carried further by Baron s examination of perceptual learning in relation to letter and word recognition Finally we consider inputs to the psycholinguistic system via speech and speech perception The strong emphasis of Pisoni s chapter on speech perception rather than production simply reflects both the predominance of research on perceptual aspects of speech in the current cognitive literature and the close relationships of this research to other lines of investigation of perception and short term memory Some knowledge of the history of the subject and some understanding of the way some of the more persuasive concepts and principles have evolved may serve present day investigators better than boosting their reading rates The final chapter of the present volume provides some documentation for this last suggestion

Computer Architecture G. Boulaye,T.R. Lewin,2012-12-06 This book presents as formal papers nearly all of the lectures given at the NATO advanced summer institute on Computer Architecture held at St Raphael France from September 12th 24th 1976 It was not possible to include an important paper by G Amdahl on the 470V6 System nor papers by Mde A Recoque on distributed processing Messrs A Maison and G Debruyne on LSI technology and K Bowden Computer architecture is a very

diverse and expanding subject consequently it was decided to limit the scope of the School to five main subject areas These were specific computer architectures language orientated machines associative processing computer networks and specification and design methods In addition an overall emphasis was placed on distributed and parallel processing and the need for an integrated hardware software approach to design Though some introductory material is included this book is primarily intended for workers in the field of computer science and engineering who wish to update themselves on current topics in computer architecture The main work of the School is well reflected in the collected papers but it is impossible to convey the benefits obtained from the discussion groups and the continuous dialogue that was maintained throughout the School The Editors would like to acknowledge with thanks the support of the NATO Scientific Affairs Division who financed the School and the European Research Office of the U S Army and the National Science Foundation for providing travel grants
