Asteroids II:

Asteroids II Richard P. Binzel, Tom Gehrels, Mildred Shapley Matthews, 1989 Asteroids II will have some bearing on meteorite research and will help to clarify our understanding of the many specimens held in both private and public collections throughout the world I commend the book without reservation J P Lavielle Impact This monograph will become indispensable for everybody engaged in the rapidly expanding asteroid research or interested in its current state Space Science Reviews This is an excellent introduction to the subject recommended for schools with astronomy programs Academic Library Review *Asteroids, Comets, Meteors* 1993 A. Milani, Mario Badiale, A. Cellino, 2012-12-06 THE MEETING The IAU Symposium 160 ASTEROIDS COMETS METEORS 1999 has been held at Villa Carlotta in Belgirate on the shore of Lago Maggiore Italy from June 14 to June 18 1993 It has been organized by the Astronomical Observatory of Torino and by the Lunar and Planetary Institute of Houston It has been a very large meeting with 323 registered participants from 38 countries The scientific program included 29 invited reviews 106 oral communications and 215 posters The subjects covered included all the aspects of the studies of the minor bodies of the solar system including asteroids comets meteors meteorites interplanetary dust with special focus on the interrelationships between these The meeting was structured as follows 5 morning plenary sessions have been devoted to invited reviews on 1 search programs 2 populations of small bodies 3 dynamics 4 physical observations and modelling 5 origin and evolution Two afternoon plenary sessions have been devoted to space missions to small bodies and to interrelationships between the different populations The afternoon parallel sessions have been devoted to dynamics of comets Toutatis Ida Gaspra physical processes in cometary comae and tails meteorites the cosmogonic message from cometary nuclei physics of asteroids the interplanetary dust complex comet nuclei meteors composition and material properties of comets dynamics of asteroids **Comets II** M. Festou, H. U. Keller, Harold A. Weaver, 2004-11 The study of comets is a field that has seen tremendous advances in recent years far surpassing the knowledge reflected in the original Comets volume published as part of the Space Science Series in 1982 This new volume with more than seventy contributing authors represents the first complete overview of comet science in more than a decade and contains the most extensive collection of knowledge yet assembled in the field Comets II situates comet science in the global context of astrophysics for the first time by beginning with a series of chapters that describe the connection between stars and planets It continues with a presentation of the formation and evolution of planetary systems enabling the reader to clearly see the key role played in our own solar system by the icy planetesimals that were the seeds of the giant planets and transneptunian objects The book presents the key results obtained during the 1990s in particular those collected during the apparition of the exceptional comets C Hyakutake and C Hale Bopp in 1996 1997 The latest results obtained from the in situ exploration of comets P Borrelly and P Wild 2 are also discussed in detail Each topic of is designed to be accessible to students or young researchers looking for basic yet detailed complete and accurate information on comet science With its

emphasis on the origin of theories and the future of research Comets II will enable scientists to make connections across disciplinary boundaries and will set the stage for discovery and new understanding in the coming years *Asteroids III* William Frederick Bottke, 2002-01-01 Two hundred years after the first asteroid was discovered asteroids can no longer be considered mere points of light in the sky Spacecraft missions advanced Earth based observation techniques and state of the art numerical models are continually revealing the detailed shapes structures geological properties and orbital characteristics of these smaller denizens of our solar system This volume brings together the latest information obtained by spacecraft combined with astronomical observations and theoretical modeling to present our best current understanding of asteroids and the clues they reveal for the origin and evolution of the solar system This collective knowledge prepared by a team of more than one hundred international authorities on asteroids includes new insights into asteroid meteorite connections possible relationships with comets and the hazards posed by asteroids colliding with Earth The book's contents include reports on surveys based on remote observation and summaries of physical properties results of in situ exploration studies of dynamical collisional cosmochemical and weathering evolutionary processes and discussions of asteroid families and the relationships between asteroids and other solar system bodies Two previous Space Science Series volumes have established standards for research into asteroids Asteroids III carries that tradition forward in a book that will stand as the definitive source on its subject for the next decade *Asteroids IV* Patrick Michel, Francesca E. DeMeo, William F. Bottke, 2015-12-31 More than forty chapters detail our current astronomical compositional geological and geophysical knowledge of asteroids as well as their unique physical processes and interrelationships with comets and meteorites Provided by publisher **Reports of Planetary Astronomy, 1990**, 1990 Space Resources: Materials, 1992 Space Resources: Energy, power, and transport United States. National Aeronautics and Space Administration. Scientific and Technical Information Program, 1992 *NASA Technical Memorandum* United States. National Aeronautics and Space Administration, 1990 *Planetary Systems Now* Luisa M Lara, David Jewitt, 2023-03-23 Planetary Systems Now offers a broad interdisciplinary perspective and introduction to the latest results from leading experts in each field It offers an unusually wide range of research on topics both inside and outside of the solar system as well as the most recent results from ongoing ground and space based investigations Experts in their field come together in this volume to discuss solar system exploration with its most recent space missions theories and evidence concerning planetary system formation and the nature and formation of exoplanets and exoplanetary systems Including both questions and answers this book is intended to be a readable heavily illustrated stepping off point for advanced undergraduate students graduate students and scientists beginning research in planetary and exoplanetary science topics **Literature 1984, Part 1** S. From Dust to Terrestrial Planets Willy Benz, R. Kallenbach, Günter Lugmair, 2012-12-06 The workshop From Dust to Terrestrial Planets was initiated by a working group of planetary scientists invited to ISSI by Johannes Geiss in November 1997 The group split to focus on three topics one of which was the history of the early solar system including the formation of the terrestrial planets in the inner solar system Willy Benz Günter Lugmair and Frank Podosek were invited to convene planetary scientists astrophysicists and cosmochemists to synthesize the current knowledge on the origin and evolution of our inner planetary system The convenors raised the interest of scientists from all over the world in the detailed assessment of the available astronomical chronological geochemical and dynamical constraints of the first period of inner solar system evolution In particular this included appraisal of the newest results from astronomical observations by the Hubble Space Telescope the Infrared Space Observatory and other space and ground based facilities of solar like systems and nebular disks possibly representing early stages of the solar accretion disk and planet formation At the same time the current models of the origin evolution transport and accretion processes of circum stellar disks were presented This included the new insights provided by the recent discovery of extrasolar giant planets which were considered insofar as they are relevant to the overall dynamics of the inner part of the solar system **Solar System Evolution** Stuart Ross Taylor, 2001-09-06 Publisher

Description **The Planetary Scientist's Companion** Katharina Lodders, Bruce Fegley Jr., 1998-12-10 Scientists have collected a wealth of physical and chemical data for the Sun planets and small bodies in our solar system but until now this information has been scattered throughout the technical literature The Planetary Scientist's Companion solves this problem providing for the first time a single extensive reference for the interdisciplinary fields of planetary science and cosmochemistry The book begins with a summary of frequently used physical and chemical constants unit conversion factors properties of some compounds and minerals thermodynamic data partition coefficients and useful formulas This is followed by an overview of the solar system including comparative data for the planets and their satellites and abundances of the elements Much of the book is devoted to a series of chapters describing in turn the Sun each of the planets and the groups of small bodies asteroids comets meteorites and Kuiper Belt and Centaur objects Each chapter includes an introduction followed by tables of physical and chemical properties compiled from many sources including data on planetary atmospheres surfaces and interiors The book concludes with data on nearby stars the interstellar medium and recently discovered brown dwarfs and possible extrasolar planets followed by a glossary A unique and practical resource for anyone interested in contemporary planetary science and cosmochemistry this volume is likely to be an essential tool in future research

Collisional Processes in the Solar System Mikhail Ya. Marov, Hans Rickman, 2012-12-06 The exploration of our Solar System is rapidly growing in importance as a scientific discipline During the last decades great progress has been achieved

as the result of space missions to planets and small bodies as asteroids and comets and improved remote sensing methods as well as due to refined techniques of laboratory measurements and a rapid progress in theoretical studies involving the development of various astrophysical and geophysical models. These models are based in particular on the approach of comparative planetology becoming a powerful tool in revealing evolutionary processes which have been shaping the planets since their origin. Comets and asteroids being identified as remnants of planetary formation serve as a clue to the reconstruction of Solar System history because they encapsulated the primordial material from which the planets were built up. At the same time these interplanetary carriers of original matter and messengers from the past being triggered by dynamical processes well outside our neighboring space were responsible for numerous catastrophic events when impacting on the planets and thus causing dramatic changes of their natural conditions. In the crossroads of astronomy and geophysics recent years have seen a growing understanding of the importance of collisional processes throughout the history of the Solar System and therefore the necessity to get more insight into the problem of interactions of planets and small bodies.
