John David Pizer

Astonishment Of Origins:

Toward a Theory of Radical Origin John David Pizer, 1995-01-01 This provocative book addresses one of the central and most controversial branches of Western thought the philosophy of origin In light of recent poststructuralist principles such as alterity difference and dissemination the philosophy of origin seems to exemplify the repressive reactionary tendencies of much of the Western philosophical tradition John Pizer aims to overturn this recent antipathy to the philosophy of origin He ably summarizes poststructuralist critiques of that earlier philosophical tradition then turns to five German thinkers Nietzsche Benjamin Rosenzweig Heidegger and Adorno who developed philosophies of origin that effectively anticipate and counter poststructuralist attacks These are thinkers who in one way or another influenced recent generations of poststructuralist thinkers Pizer argues however that rather than do away with the notion of origin altogether as in the works of the most thoroughgoing poststructuralists these philosophers developed theories in which origin is always multiple and plurivalent In the writings of these seminal German thinkers origin becomes origins and authentic origins are inherently plural and divergent A valuable engrossing account of a wide range of thinkers and their complex relations Pizer's book recovers the notion of origin for an intellectual world that has come to value multiplicity openness and diversity

On the Origin of Species Charles Darwin, 2024-01-24 On the Origin of Species published on 24 November 1859 is a work of scientific literature by Charles Darwin which is considered to be the foundation of evolutionary biology Its full title was On the Origin of Species by Means of Natural Selection or the Preservation of Favoured Races in the Struggle for Life For the sixth edition of 1872 the short title was changed to The Origin of Species Darwin's book introduced the scientific theory that populations evolve over the course of generations through a process of natural selection It presented a body of evidence that the diversity of life arose by common descent through a branching pattern of evolution Darwin included evidence that he had gathered on the Beagle expedition in the 1830s and his subsequent findings from research correspondence and experimentation Various evolutionary ideas had already been proposed to explain new findings in biology There was growing support for such ideas among dissident anatomists and the general public but during the first half

of the 19th century the English scientific establishment was closely tied to the Church of England while science was part of natural theology Ideas about the transmutation of species were controversial as they conflicted with the beliefs that species were unchanging parts of a designed hierarchy and that humans were unique unrelated to other animals The political and theological implications were intensely debated but transmutation was not accepted by the scientific mainstream The book was written for non specialist readers and attracted widespread interest upon its publication As Darwin was an eminent scientist his findings were taken seriously and the evidence he presented generated scientific philosophical and religious discussion The debate over the book contributed to the campaign by T H Huxley and his fellow members of the X Club to secularise science by promoting scientific naturalism Within two decades there was widespread scientific agreement that evolution with a branching pattern of common descent had occurred but scientists were slow to give natural selection the significance that Darwin thought appropriate During the eclipse of Darwinism from the 1880s to the 1930s various other mechanisms of evolution were given more credit With the development of the modern evolutionary synthesis in the 1930s and 1940s Darwin s concept of evolutionary adaptation through natural selection became central to modern evolutionary theory and it has now become the unifying concept of the life sciences Summary of Darwin s theory Darwin s theory of evolution is based on key facts and the inferences drawn from them which biologist Ernst Mayr summarised as follows Every species is fertile enough that if all offspring survived to reproduce the population would grow fact Despite periodic fluctuations populations remain roughly the same size fact Resources such as food are limited and are relatively stable over time fact A struggle for survival ensues inference Individuals in a population vary significantly from one another fact Much of this variation is inheritable fact Individuals less suited to the environment are less likely to survive and less likely to reproduce individuals more suited to the environment are more likely to survive and more likely to reproduce and leave their inheritable traits to future generations which produces the process of natural selection inference This slowly effected process results in populations changing to adapt to their environments and ultimately these variations accumulate over time to form new species inference
