Jürgen Becker, Marco Platzner, Serge Vernalde, 2004-08-19 This book constitutes the refereed proceedings of the 14th International Conference on Field Programmable Logic FPL 2003 held in Leuven Belgium in August September 2004 The 78 revised full papers 45 revised short papers and 29 poster abstracts presented together with 3 keynote contributions and 3 tutorial summaries were carefully reviewed and selected from 285 papers submitted The papers are organized in topical sections on organic and biologic computing security and cryptography platform based design algorithms and architectures acceleration application architecture physical design arithmetic multitasking circuit technology network processing testing applications signal processing computational models and compiler dynamic reconfiguration networks and optimisation algorithms system on chip high speed design image processing network on chip power aware design IP based design co processing architectures system level design physical interconnect computational models cryptography and compression network applications and architecture and debugging and test **Improved Speech Coding Based on Open-loop**

Parameter Estimation Jer-Nan Juang, 2000 A nonlinear optimization algorithm for linear predictive speech coding was developed early that not only optimizes the linear model coefficients for the open loop predictor but does the optimization including the effects of quantization of the transmitted residual It also simultaneously optimizes the quantization levels used for each speech segment In this paper we present an improved method for initialization of this nonlinear algorithm and

demonstrate substantial improvements in performance In addition the new procedure produces monotonically improving speech quality with increasing numbers of bits used in the transmitted error residual Examples of speech encoding and decoding are given for 8 speech segments and signal to noise levels as high as 47 dB are produced As in typical linear predictive coding the optimization is done on the open loop speech analysis model Here we demonstrate that minimizing the error of the closed loop speech reconstruction instead of the simpler open loop optimization is likely to produce negligible improvement in speech quality The examples suggest that the algorithm here is close to giving the best performance obtainable from a linear model for the chosen order with the chosen number of bits for the codebook
