Furie, Peter J. Kelly, 2004-04-28 Despite major advances in the understanding of stroke mechanisms that have occurred over the past quarter century stroke continues to rank among the leading causes of death and disability worldwide Although

currently it may be difficult to believe early doubts were expressed as to whether interventions in risk factors for either coronary disease or stroke would actually lead to a reduction in the incidence of these disorders. However, large clinical trials in hypertension, carotid disease, atrial fibrillation, and antithrombotic and antiplatelet therapies have effectively demonstrated the efficacy of these targeted interventions in reducing stroke incidence. More recently, after earlier uncertainty regarding the role of elevated lipids as a risk factor for stroke, clinical trials of the statins have also demonstrated a significant reduction in the incidence of ischemic stroke. However, as emphasized in *Handbook of Stroke Prevention in Clinical Practice*, despite these gains and the initial decline in stroke incidence that did occur in the 1960s and 1970s, the incidence of stroke disappointingly has failed to show a further significant decline since that time. The editors of *Handbook of Stroke Prevention in Clinical Practice* raise the very important question of whether recognized strategies for stroke prevention have been widely or effectively implemented. They correctly emphasize the critical importance of identifying the mechanism of stroke in each patient so as to properly direct prevention and treatment. As Dr Helen McVeigh, 2016-05-23 Underpinned by relevant epidemiology, demography, and policy, this book explores the management of long-term conditions. It discusses communication and multidisciplinary working, including discussion of the student nurse's role. Each chapter includes learning points and uses a questioning, reflective approach which draws on the reader's own experiences.

Long-Term Effects of Stroke Julian Bogousslavsky, 2002-06-21 Evaluating the major strategies used to prevent stroke recurrence, such as antiplatelet and anticoagulant therapies, this reference assesses the efficacy of pharmacological interventions, therapeutic regimens, and quality of care for stroke patients; detecting risk factors and potential mechanisms of stroke to prevent functional disability and increase quality of life; independence and psychological well-being in post-stroke management programs. Considers the complex issue of cost vs. benefit in post-stroke rehabilitation. Addressing common dysfunctions that occur after stroke, including motor impairment, neurobehavioral changes, cognitive loss, emotional disorders, and dementia. *Long-Term Effects of Stroke* discusses the patterns and epidemiology of ischemic and hemorrhagic stroke; the development of neurobiologically based therapeutic strategies; the possible emergence of depression, anxiety, mania, and psychosis after stroke; pharmacological and cell-based modalities to enhance stroke recovery. Offering perspectives from leading international authorities in the field, *Long-Term Effects of Stroke* is a unique and valuable guide for clinical neurologists, cardiologists, cardiovascular specialists, cardiac, cardiovascular, and vascular surgeons, neurosurgeons, primary care, family practice, emergency room, and internal medicine physicians, physiologists, nurses, paramedical, and emergency medical personnel, and medical school students in these disciplines.

Neurochemical Aspects of Neurotraumatic and Neurodegenerative Diseases Akhlaq A. Farooqui, 2010-09-02 Collectively neurodegenerative diseases are characterized by chronic and progressive loss of neurons in discrete areas of the brain producing debilitating symptoms such as dementia loss of memory loss of sensory or motor capability decreased overall quality of life eventually leading to premature death Two types of cell death are known to occur during neurodegeneration a apoptosis and b necrosis The necrosis is characterized by the passive cell swelling intense mitochondrial damage with rapid loss of ATP alterations in neural membrane permeability high calcium influx and disruption of ion homeostasis This type of cell death leads to membrane lysis and release of intracellular components that induce inflammatory reactions Necrotic cell death normally occurs at the core of injury site In contrast apoptosis is an active process in which caspases a group of endoproteases with specificity for aspartate residues in protein are stimulated Apoptotic cell death is accompanied by cell shrinkage dynamic membrane blebbing chromatin condensation DNA laddering loss of phospholipids asymmetry low ATP levels and mild calcium overload This type of cell death normally occurs in penumbral

region at the ischemic injury site and in different regions in various neurodegenerative diseases

approximately 70% of all cases globally Recent advancements in brain imaging techniques have significantly expanded the treatment window for reperfusion therapies in carefully selected patients resulting in improved functional outcomes in the short and long term Intravenous thrombolysis IVT has proven effective in reducing disability when administered for up to 9 hours in patients with detectable salvageable brain tissue on perfusion imaging Endovascular thrombectomy EVT has emerged as a beneficial intervention for a wide range of patients with large vessel occlusion even up to 24 hours after stroke onset provided appropriate patient selection based on imaging criteria Conversely recent trials have demonstrated the superior efficacy of intensive pharmacological approaches such as dual antiplatelet therapy DAPT in preventing ischemic stroke recurrence particularly in high risk patients Despite significant advancements several controversies persist in the field of ischemic stroke management These controversies encompass various topics including determining the optimal secondary prevention strategy for patients with patent foramen ovale or strategies for ischemic stroke prevention in patients with atrial fibrillation following intracerebral hemorrhage Furthermore ongoing debates exist regarding the actual effectiveness of EVT in patients with large ischemic core distal vessel occlusion mild stroke syndromes or high baseline disability Additionally the comparative utility of IVT versus dual antiplatelet therapy for minor ischemic strokes remains a contentious issue Moreover discussions revolve around identifying the optimal delivery paradigm for EVT such as the choice between the drip and ship approach versus the mothership model
