

Birth-Death Markov Chains

- A Markov chain represents a **birth-death process** when the state transitions in the chain occur only among adjacent states: from state i we can directly go only to state $i+1$ or $i-1$.

- A Markov chain of the birth-death type can be used to **model** a queue with Poisson arrivals and exponential service times. These types of queues are denoted by symbols like **M/M/.../...**, according to the Kendall's notation.
