- Cortical Spreading Depression:
- FHM1 mutant presynaptic voltage gated Ca channels open to small membrane depolarizations
- Neuronal excitability is increased with more influx of Ca, release of glutamate and K
- FHM2: extracellular K builds up because mutant Na/K ATPase cannot bind K and exchange for Na results in increase glutamate
- ATP required to maintain neuronal membrane potential and used up to quickly

Alternating Hemiplegia of Childhood Frederick Andermann, Jean Aicardi, Federico Vigevano, 1995 **Alternating Hemiplegia of Childhood**, 1998 **Pediatric Neurology** Sujay Kansagra, Mohamad A. Mikati, Federico Vigevano, 2013-04-23 Alternating hemiplegia of childhood AHC is a very rare disease characterized by recurrent attacks of loss of muscular tone resulting in hypomobility of one side of the body The etiology of the disease due to ATP1A3 gene mutations in the majority of patients Few familial cases have been described AHC has an onset in the first few months of life Hemiplegic episodes are often accompanied by other paroxysmal manifestations such as lateral eyes and head deviation toward the hemiplegic side and a very peculiar monocular nystagmus As the attack progresses hemiplegia can shift to the other side of the body Sometimes the attack can provoke bilateral paralysis and these patients may have severe clinical impairment with difficulty in swallowing and breathing Hemiplegic attacks may be triggered by different stimuli like bath in warm water motor activity or emotion The frequency of attacks is high usually several in a month or in a week The duration is variable from a few minutes to several hours or even days Sleep can stop the attack Movement disorders such as dystonia and abnormal movements are frequent Cognitive delay of variable degree is a common feature Epilepsy has been reported in 50% of the cases but seizure onset is usually during the third or fourth year of life Many drugs have been used in AHC with very few results Flunarizine has the most supportive anecdotal evidence regarding efficacy *Epilepsy and Movement Disorders* Renzo Guerrini, 2002 The boundaries between epilepsy and movement disorders are difficult to define some syndromes or diseases may combine the two and many manifestations of one are similar to the other For the first time a distinguished international team of specialists comprehensively examines the clinical neurophysiological genetic pharmacological and molecular factors which underlie the relationships and differences between the two disorders They examine the methods for investigating motor cortex excitability and the electrophysiological and chemical characteristics of epilepsies which resemble movement disorders They present a scheme for neurophysiological classification of myoclonic epilepsies and myoclonus and give a detailed analysis of the disorders which cause diagnostic problems in children and adults There is also an innovative up to date review of the genetic syndromes which associate epilepsy and paroxysmal dyskinesias and a review of the drugs used to treat or which may precipitate epilepsy and movement disorders This is essential reading for clinicians and neuroscientists **Non-epileptic Childhood Paroxysmal Disorders** Francis J. DiMario, 2009 This is a book written for those of us who evaluate the many quirks and behaviors encountered in the lives of developing children The number of important pathologic conditions that befall this age group is staggering However equally staggering is the number of episodic and often benign or developmentally programmed paroxysmal events encountered in this population The nature of these episodic events in many circumstances leads to their erroneous identification as epileptic in nature It is my hope that this book will serve as a compendium of those episodically manifest entities often uniquely

observed in childhood The book is organized with some foundations in terminology and an in depth analysis of epidemiology of many of these disorders As best possible epidemiologic data are compiled with incidence and prevalence figures provided for comparisons Discussion on the deductive approach to their clinical assessment is provided along with emphasis on the diagnostic clues contained within the descriptive and observational information provided during clinical evaluation A categorization of the differential features and ages of presentation are provided as a means to help direct logical diagnostic considerations Subsequent chapters are organized by major topic i e Syncopes Sleep Phenomena Somatization Factitious Illness Movement Disorders and Migraine Syndromes Each chapter provides discourse on the general principles of underlying pathophysiologic mechanisms and current knowledge about the chapter topic under discussion Specific clinical entities encompassed within the general topic are then discussed individually with particular attention to their clinical descriptions and presentations natural history particular pathophysiology genetics pertinent laboratory and treatments The text is amplified by pertinent tables highlighting diagnostic criteria where this applies and reference information where needed The text is generously referenced to encompass the most relevant information available

Pediatric Neurology, Part II Olivier Dulac, Maryse Lassonde, Harvey B. Sarnat, 2013-04-23 The child is neither an adult miniature nor an immature human being at each age it expresses specific abilities that optimize adaptation to its environment and development of new acquisitions Diseases in children cover all specialties encountered in adulthood and neurology involves a particularly large area ranging from the brain to the striated muscle the generation and functioning of which require half the genes of the whole genome and a majority of mitochondrial ones Human being nervous system is sensitive to prenatal aggression is particularly immature at birth and development may be affected by a whole range of age dependent disorders distinct from those that occur in adults Even diseases more often encountered in adulthood than childhood may have specific expression in the developing nervous system The course of chronic neurological diseases beginning before adolescence remains distinct from that of adult pathology not only from the cognitive but also motor perspective right into adulthood and a whole area is developing for adult neurologists to care for these children with persisting neurological diseases when they become adults Just as pediatric neurology evolved as an identified specialty as the volume and complexity of data became too much for the general pediatrician or the adult neurologist to master the discipline has now continued to evolve into so many subspecialties such as epilepsy neuromuscular disease stroke malformations

neonatal neurology metabolic diseases etc that the general pediatric neurologist no longer can reasonably possess in depth expertise in all areas particularly in dealing with complex cases Subspecialty expertise thus is provided to some trainees through fellowship programmes following a general pediatric neurology residency and many of these fellowships include training in research Since the infectious context the genetic background and medical practice vary throughout the world this diversity needs to be represented in a pediatric neurology textbook Taken together and although brain malformations H Sarnat P Curatolo 2007 and oncology W Grisold R Soffietti are covered in detail in other volumes of the same series and therefore only briefly addressed here these considerations justify the number of volumes and the number of authors who contributed from all over the world Experts in the different subspecialties also contributed to design the general framework and contents of the book Special emphasis is given to the developmental aspect and normal development is reminded whenever needed brain muscle and the immune system The course of chronic diseases into adulthood and ethical issues specific to the developing nervous system are also addressed A volume in the Handbook of Clinical Neurology series which has an unparalleled reputation as the world's most comprehensive source of information in neurology International list of contributors including the leading workers in the field Describes the advances which have occurred in clinical neurology and the neurosciences their impact on the understanding of neurological disorders and on patient care **Current**
