Cracks In Composite Materials A Compilation Of Streb Solutions For Composite Systems With Cracks:

Cracks in composite materials George C. Sih, E.P. Chen, 1981-11-30 Composites offer great promise as light weight and strong materials for high performance structures One of the major advantages of these materials as compared with metals is the basic way in which heterogeneity resist crack extension In a fiber matrix composite system the fibers tend to cause cracks to form at closer spacing and delay the formation of a large crack The enhancement of local failure such as fiber breaking matrix cracking and interface debonding further reduces the energy level which might have otherwise reached the point of catastrophic failure Even though substantial tests have been made on composite materials little has been gained in the understanding and development of a predictive procedure for composite failure There are fundamental difficulties associated with incorporating the nonhomogeneous and anisotropic properties of the composite into the continuum mechanics analysis Additional uncertainties arise from voids and defects that are introduced in the composite during manufacturing Even a small quantity of mechanical imperfections can cause a marked influence on the composite strength Moreover the interface properties between the fibers and matrix or bonded laminae can also affect the load transmission characteristics significantly It would be impossible to establish predictive procedures for composite failure unless realistic guidelines could be developed to control the manufacturing quality of composite systems Ceramic Abstracts American Ceramic Society, 1979

Fracture Mechanics of Composites G. P. Sendeckyj, 1975 Fracture and Damage of Composites M. H. Aliabadi, M. Guagliano, 2006 Covering various aspects of dynamic fractures this book contains state of the art contributions from leading scientists in the field of crack dynamics

Interface Fracture and Delaminations in Composite Materials Leslie Banks-Sills, 2017-07-05 Part I of this SpringerBrief presents the problem of a crack between two dissimilar isotropic materials and describes the mathematical background A fracture criterion is discussed and Methods for calculating fracture parameters such as stress intensity factors using the finite element method and three post processors are considered Actual test data and both deterministic and statistical failure curves are presented In Part II of the book similar descriptions are given for delaminations in composite laminates The mathematical treatment of this type of damage including the first term of the asymptotic expansion of the stress and displacement fields is considered Numerical post processors for determining stress intensity factors for these cases are reviewed Two examples of specific laminates are presented one with a failure curve and the other with a failure surface Finally beam specimens used for testing such failures are discussed
