Change Blindness And Visual Memory:

Change Blindness and Visual Memory Daniel J. Simons, 2018-12-02 A central goal in the study of object and scene perception is to understand how visual information is integrated across views to provide a stable continuous experience of our environment Research on issues ranging from visual masking to priming across saccades to the representation of spatial layout across views has addressed the issue of what information is preserved from one view to the next Recently research on visual memory for objects and scenes has led to striking claims about the nature of the information that is and is not preserved from one instant to the next For example studies of change blindness have shown that striking changes to objects and scenes can go undetected when they coincide with an eye movement a flashed blank screen a blink or an occlusion event These studies suggest that relatively little visual information about objects and scenes is combined across views Despite these failures of change detection observers somehow manage to experience a stable continuous visual environment This special issue seeks to unite recent studies of change blindness with studies of visual integration to better understand the nature of our representations and the richness of our visual memory

Visual Memory Steven J. Luck, Andrew Hollingworth, 2008-09-10 Vision and memory are two of the most intensively studied topics in psychology and neuroscience This book provides a state of the art account of visual memory systems Each chapter is written by an internationally renowned researcher who has made seminal contributions to the topic

Attention, Visual Memory, and Change Blindness Sara Kendall Senkbeil, 2012 ABSTRACT Under normal conditions individuals effortlessly allocate attention to detect changes in their surroundings due to the motion signals arising from those changes Becker Pashler Anstis 2000 However when visual changes coincide with natural e g eye saccades or induced visual disruptions e g blank delays between stimuli called interstimulus intervals or ISIs these changes often go unnoticed due to a phenomenon called change blindness Rensink O Regan Clark 1997 Outside of the laboratory existing

driving literature has revealed that drivers feel safe glancing away from the road for 0.8 seconds s provided they have 3.0 s to view the road between wayward glances Green 1999 This experiment examined the role of individual differences in change detection performance across a range of ISIs i.e 0 s to 2.0 s and across possible e.g pedestrian changes orientation and impossible changes e.g green stop sign Change detection accuracy and the mean iterations participants required to detect possible changes declined as the ISI increased regardless of their working memory capacity or visual short term memory capacity The results show glances away from the road should be very brief because all individuals regardless of working memory capacity are susceptible to overlooking changes in their surroundings

Perception: First Form of Mind Tyler Burge, 2022-05-13 In Perception First Form of Mind Tyler Burge develops an understanding of the most primitive type of mental representational perception Focusing on the functions and capacities of perceptual states Burge accounts for their representational content and structure and develops a formal semantics for them The discussion explains the role of iconic format in the structure It also situates the accounts of content structure and semantics within scientific explanations of perceptual state formation emphasizing formation of perceptual categorization In the book's second half Burge discusses what a perceptual system is Exploration of relations between perception and other primitive capacities conation attention memory anticipation affect learning and imagining helps distinguish perceiving with its associated capacities from thinking with its associated capacities Drawing mainly on vision science not introspection Perception First Form of Mind is a rigorous agenda setting work in philosophy of perception and philosophy of science

Mathematical Models of Perception and Cognition Volume II Joseph Houpt, Leslie M. Blaha, 2016-05-20 In this two volume festschrift contributors explore the theoretical developments Volume I and applications Volume II in traditional cognitive psychology domains and model other areas of human performance that benefit from rigorous mathematical approaches It brings together former classmates students and colleagues of Dr James T Townsend a pioneering researcher in the field since the early 1960s to provide a current overview of mathematical modeling in psychology Townsend's research critically emphasized a need for rigor in the practice of cognitive modeling and for providing mathematical definition and structure to ill defined psychological topics The research captured demonstrates how the interplay of theory and application bridged by rigorous mathematics can move cognitive modeling forward

Unconscious Memory Representations in Perception István Czigler, István Winkler, 2010 Perceptual experience emerges from neural computations Unconscious Memory Representations in Perception focuses on the role of implicit non conscious memories in processing sensory information Making sense of the wealth of information arriving at our senses requires implicit memories which represent environmental regularities contingencies of the sensory input as well as general contextual knowledge Recent findings and theories in cognitive and computational neuroscience provided new insights into the structure and contents of implicit memory representations The chapters of this book examine implicit memories both in relatively simple situations such as perceiving auditory and visual objects as well as in high level

cognitive functions such as speech and music perception and aesthetic experience By nature implicit memories cannot be directly studied with behavioral methods Therefore a large part of the evidence reviewed was obtained in neuroscientific studies Readers with limited experience in neuroscience will find information about the most commonly used techniques in the appendix of this volume Series B

Cognitive Processes in Eye Guidance Geoffrey Underwood, 2005-07-28 Whether reading looking at a picture or driving how is it that we know where to look next how does the human visual system calculate where our gaze should be directed in order to achieve our cognitive aims This book brings together leading vision scientists studying eye movements across a range of activities such as reading driving computer activities and chess It provides groundbreaking new research that will help us understand how it is that we know where to move our eyes and thereby better understand the cognitive processes underlying these activities

Consciousness as a Scientific Concept Elizabeth Irvine, 2012-10-13 The source of endless speculation and public curiosity our scientific quest for the origins of human consciousness has expanded along with the technical capabilities of science itself and remains one of the key topics able to fire public as much as academic interest Yet many problematic issues identified in this important new book remain unresolved Focusing on a series of methodological difficulties swirling around consciousness research the contributors to this volume suggest that consciousness is in fact not a wholly viable scientific concept Supporting this eliminativist stance are assessments of the current theories and methods of consciousness science in their own terms as well as applications of good scientific practice criteria from the philosophy of science For example the work identifies the central problem of the misuse of qualitative difference and dissociation paradigms often deployed to identify measures of consciousness It also examines the difficulties that attend the wide range of experimental protocols used to operationalise consciousness and the implications this has on the findings of integrative approaches across behavioural and neurophysiological research The work also explores the significant mismatch between the common intuitions about the content of consciousness that motivate much of the current science and the actual properties of the neural processes underlying sensory and cognitive phenomena Even as it makes the negative eliminativist case the strong empirical grounding in this volume also allows positive characterisations to be made about the products of the current science of consciousness facilitating a re identification of target phenomena and valid research questions for the mind sciences

The Oxford Handbook of Eye Movements Simon Liversedge, Iain Gilchrist, Stefan Everling, 2011-08-18 In the past few years there has been an explosion of eye movement research in cognitive science and neuroscience The Oxford Handbook of Eye Movements provides the first comprehensive review of the entire field of eye movement research This book is the definitive reference work in this field

The Visual Neurosciences John S. Werner (editor.), Leo M. Chalupa, 2004 An essential reference book for visual science

Cognitive Vision Brian H. Ross, David Irwin, 2003-06-04 Use of visual information is used to augment our knowledge decide on our actions and keep track of our environment Even with eyes closed people can remember visual and spatial

representations manipulate them and make decisions about them The chapters in Volume 42 of Psychology of Learning and Motivation discuss the ways cognition interacts with visual processes and visual representations with coverage of figure ground assignment spatial and visual working memory object identification and visual search spatial navigation and visual attention Change Blindness and Cueing ,2014 **Encyclopedia of Consciousness** William P. Consciousness has long been a subject of interest in philosophy and religion but only relatively recently has it become subject to scientific investigation Now more than ever before we are beginning to understand this mental state Developmental psychologists understand when we first develop a sense of self neuropsychologists see which parts of the brain activate when we think about ourselves and which parts of the brain control that awareness Cognitive scientists have mapped the circuitry that allows machines to have some form of self awareness and neuroscientists investigate similar circuitry in the human brain Research that once was separate inquiries in discreet disciplines is converging List serves and small conferences focused on consciousness are proliferating New journals have emerged in this field A huge number of monographs and edited treatises have recently been published on consciousness but there is no recognized entry point to the field no comprehensive summary This encyclopedia is that reference Organized alphabetically by topic coverage encompasses a summary of major research and scientific thought regarding the nature of consciousness the neural circuitry involved how the brain body and world interact and our understanding of subjective states The work includes contributions covering neuroscience psychology philosophy and artificial intelligence to provide a comprehensive backdrop to recent and ongoing investigations into the nature of conscious experience from a philosophical psychological and biological perspective **The Multisensory Driver** Dr Cristy Ho,Professor Charles Spence,2012-10-01 Driver inattention has been identified as one of the leading causes for car accidents The problem of distraction while driving is likely to worsen partly due to increasingly complex in car technologies However intelligent transport systems are being developed to assist drivers and to ensure a safe road environment One approach to the design of ergonomic automobile systems is to integrate our understanding of the human information processing systems into the design process This book aims to further the design of ergonomic multisensory interfaces using research from the fast growing field of cognitive neuroscience It focuses on two aspects of driver information processing in particular multisensory interactions and the spatial distribution of attention in driving The Multisensory Driver provides interface design guidelines together with a detailed review of current cognitive neuroscience and behavioural research in multisensory human perception which will help the development of ergonomic interfaces The discussion on spatial attention is particularly relevant for car interface designers but it will also appeal to cognitive psychologists interested in spatial attention and the applications of these theoretical research findings Giving a detailed description of a cohesive series of psychophysical experiments on multisensory warning signals conducted in both laboratory and simulator settings this book provides an approach for those in the engineering discipline who wish to test their systems with human observers From

Perception to Consciousness Jeremy Wolfe, Lynn Robertson, 2012-05-24 This volume includes seminal articles published throughout Anne Treisman's scientific career which are accompanied by chapters from key figures in the field today These demonstrate the breadth and depth of her influence on research and theory from psychology to vision and auditory sciences

The Handbook of Attention Jonathan Fawcett, Evan Risko, Alan Kingstone, 2015-11-13 An authoritative overview of current research on human attention emphasizing the relation between cognitive phenomena observed in the laboratory and in the real world Laboratory research on human attention has often been conducted under conditions that bear little resemblance to the complexity of our everyday lives Although this research has yielded interesting discoveries few scholars have truly connected these findings to natural experiences This book bridges the gap between laboratory and life by bringing together cutting edge research using traditional methodologies with research that focuses on attention in everyday contexts It offers definitive reviews by both established and rising research stars on foundational topics such as visual attention and cognitive control underrepresented domains such as auditory and temporal attention and emerging areas of investigation such as mind wandering and embodied attention The contributors discuss a range of approaches and methodologies including psychophysics mental chronometry stationary and mobile eye tracking and electrophysiological and functional brain imaging Chapters on everyday attention consider such diverse activities as driving shopping reading multitasking and playing videogames All chapters present their topics in the same overall format historical context current research the possible integration of laboratory and real world approaches future directions and key and outstanding issues Contributors Richard A Abrams Lewis Baker Daphne Bavelier Virginia Best Adam B Blake Paul W Burgess Alan D Castel Karen Collins Mike J Dixon Sidney K D Mello Julia F Cker Charles L Folk Tom Foulsham Jonathan A Fugelsang Bradley S Gibson Matthias S Gobel Davood G Gozli Arthur C Graesser Peter A Hancock Kevin A Harrigan Simone G Heideman Cristy Ho Roxane J Itier Gustav Kuhn Michael F Land Mallorie Leininger Daniel Levin Steven J Luck Gerald Matthews Daniel Memmert Stephen Monsell Meeneley Nazarian Anna C Nobre Andrew M Olney Kerri Pickel Jay Pratt Keith Rayner Daniel C Richardson Evan F Risko Barbara Shinn Cunningham Vivian Siu Jonathan Smallwood Charles Spence David Strayer Pedro Sztybel Benjamin W Tatler Eric T Taylor Jeff Templeton Robert Teshka Michel Wedel Blaire J Weidler Lisa Wojtowicz Jeremy M Wolfe Geoffrey F Woodman

The Oxford Companion to Consciousness Tim Bayne, Axel Cleeremans, Patrick Wilken, 2009 Consciousness is undoubtedly one of the last remaining scientific mysteries and hence one of the greatest contemporary scientific challenges How does the brain's activity result in the rich phenomenology that characterizes our waking life Are animals conscious Why did consciousness evolve How does science

proceed to answer such questions Can we define what consciousness is Can we measure it Can we use experimental results to further our understanding of disorders of consciousness such as those seen in schizophrenia delirium or altered states of consciousness These questions are at the heart of contemporary research in the domain Answering them requires a fundamentally interdisciplinary approach that engages not only philosophers but also neuroscientists and psychologists in a joint effort to develop novel approaches that reflect both the stunning recent advances in imaging methods as well as the continuing refinement of our concepts of consciousness In this light the Oxford Companion to Consciousness is the most complete authoritative survey of contemporary research on consciousness Five years in the making and including over 250 concise entries written by leaders in the field the volume covers both fundamental knowledge as well as more recent advances in this rapidly changing domain Structured as an easy to use dictionary and extensively cross referenced the Companion offers contributions from philosophy of mind to neuroscience from experimental psychology to clinical findings so reflecting the profoundly interdisciplinary nature of the domain Particular care has been taken to ensure that each of the entries is accessible to the general reader and that the overall volume represents a comprehensive snapshot of the contemporary study of consciousness The result is a unique compendium that will prove indispensable to anyone interested in consciousness from beginning students wishing to clarify a concept to professional consciousness researchers looking for the best characterization of a particular phenomenon

Current Issues in Applied Memory Research Graham M. Davies, Daniel B. Wright, 2009-12-04 Research on applied memory is one of the most active interesting and vibrant areas in experimental psychology This book describes cutting edge research and applies it to key areas of contemporary investigation education the law and neuroscience
